Greetings!

It's a neat idea that has simplified things. But, it's like
re-inventing the wheel. The only thing I can ascertain, is to "beef
up" the output to drive a heavier signal for amplification. It's just
more complex in having to use discretes that have to be selected to
properly obtain what a IC has already done!

But, isn't that the function of the Balanced Modulator?

I believe the BM [no pun here] uses a PIN network to perform such a
function for mixing and offset.

Greetings!

The 77-285 - full blown with a lot of bells and whistles.

If you like the Grant, this isn't a "drop-in" replacement - it does
have some flaws and maybe a bit noisy at times for your tastes but it
does work well.

Smaller package - but then a PC76XLW/LT might do the trick better!

Laying it on its side won't hurt it but taking it off and putting it
on the car once a day will probably cause fatigue in the case and may
cause a problem in the future.

Its not legal to modify a CB. Whatever you do don't try to modify it
yourself. It takes many years and many ruined radios before you get
the "touch."

> conveyed at the crossovers.

I think this is splitting hairs - as one wanders into the land of obfuscation. If you consider that -any- non-linearity is going to generate harmonics I think Sean's blanket statement is quite correct. What is most important is that the harmonic content is going to change depending upon the matching of the output transistors. For instance, if they are perfectly matched yet there is inadequate bias, there will be primarily odd-order distortion products. In the case of CB, these are going to fall on thrice the operating frequency, or about 81MHz. If the transistors are biased up well into their conduction curve and drawing equal idle current, yet the two output devices do not have identical gain characteristics (this does happen, believe me!), the harmonic content is going to be primarily even-order. In this case, it'll be centered on approximately 54MHz, and I don't think I need to tell you that this is dangerously close to Channel 2 on your television and where your neighbors start to get involved.

> If the drive signal is not split equally there
> will be an imbalance regardless of the level of
> bias.

Not necessarily so. Remember the signal is not split or "halved" to each output device. They are fed with mirror images of the same signal. Ideally the amplitudes should be the same, but I think you'll find in many an amplifier they are not - this is particularly true of amplifiers with multiple output devices. You must remember that each halved signal, regardless of amplitude, is going to be pure.

> Bias and the input drive signal are separate
> entities.

Yes.

> You're more likely to have an imbalance
> with a biased amp because the bias to the different
> pair can be unequal. That can't be a problem when
> all the transistor bases are DC grounded.

I don't think I quite agree with this (perhaps because I don't fully understand what you are trying to say) The bias set point has no bearing on the conduction curve of the output devices and therefore has none on the linearity of these two (or more) components. The only time that it would have bearing is if the output devices were mis-matched. That said, in your typical illegal CB amplifier, the non-linearity problem is most likely caused by the saturation of the output

transformer core. This results in even order distortion products. (see above). Said another way, having zero volts bias on the transistors does not perform any kind of matching function.

Joe, firstly, I have no idea what radio you are talking about.

It is possible, and common, to increase the drive voltage in a typical current amplifier used dynamically. A picture is worth a thousand words here. But I am limited to text. Basically what you want to achieve is increasing (or decreasing) the rail voltage of the previous stage. What this allows you to do it fully saturate the device driving the output device and therefore -pull- your output device to its own rail voltage.

To confuse matters further I've found a link.
http://www-us2.semiconductors.philips.com/pip/TDA1020

This is a very common amplifier used in audio (it is actually quite a good one too that I'm very familiar with). If you look at the block diagram on page 3, and then the sample circuit on page 7, you can see that the output is pin 2. You will also see that pin 4 goes back to the drive on the output stage. What you do is place a capacitor between the output and the "bootstrapping" input to bump up the maximum voltage that can be driven into the top output device. How effective is this technique? Check the specifications on page and compare power with and without.

You could easily apply the same technique to an emitter follower in a CB, but the signal must be dynamic - that is to say, modulated.

If this is too heavy for young players I apologize but I've tried to simplify it.

An 8 pill would be the max you could use. The driver would have to be on the
13.8 volts side.

Scientists "predict" the cycle the same way they have for a couple
hundred years and the same way we can.Look at the progress of the cycle
in terms of average # of visible sunspots per month and compare this to
the closest looking cycle from the VERY SMALL group of data from the
past.
Anyone(including scientists and the ARRL)who tried to predict the
cycle before it was even 1/2 way to peak was a fool.
I predict a very weak and low peaking cycle,much like those of the
Maunder minimum,I could be wrong.

> I disagree. It is commonly held that single conversion receivers are the
> best for SSB work.

"Commonly held"? Hmmm. I don't know of any decent commercial/
ham HF rig that is not double conversion - if not triple or
even quad conversion. There's all sorts of things with which
to be concerned here - esp. IMD. The one HF rig I know of that
has a single conversion receiver is the SGC-2020, a little $600
20W HF "survival" rig. It did not get very a favorable tech
review in QST (totally disregarding ergonomic issues). Just
didn't have good "crowded-band" performance.

Bill Sabin - of Rockwell/Collins fame - wrote the excellent
Rcvrs & Transmitters chapter in the later ARRL handbooks.
Really delves into a lot of the tradeoffs btwn receiver
design variations. Recommended reading; going thru some of
the math helps but you can still get a broad view by just
going thru the textual material...

> The selectivity is accomplished entirely by the Xtal filter.
> So profoundly so that additional conversion stages can only
> add noise. If more gain is required, to make it more sensitive,
> this can be easily addressed without adding another stage of
> conversion.

Well, now, an xtal filter running at a high IF freq is gonna
have a wide bandwidth - say 20kHz or so. So while of course
useful up there to keep the IF amp(s) happy, you still need a
narrow bandwidth filter at a lower IF freq. to get your 500Hz
CW bandwidth or 1.8kHz - 3kHz SSB bandwidth. A high-IF-freq
xtal filter with a very very very low bandwidth would be

tremendously expensive.

> > - Various bandwidths of *crystal* filtering at the 1st &

> the spectrum. Well, there is in a sense but let us not go there right
> now. :->

Often SSB HF is run w/1.8 or 2kHz bandwidth. While voice quality
may be reduced, it is better than having all sorts of crapola
on top of it. It is nice also to run narrower-band AM sometime;
while normally 6kHz bandwidth, you might wanna pinch it down to
around 4kHz in bad conditions (heterodynes, nearby signals, etc.)
During SW listening I sometimes switch to SSB and zero-beat the
signal so I then can take advantage of narrow SSB filters. Again,
voices aren't rendered as well but it helps cut out some junk...

> becomes a software issue now.

Yes, loop filters, quality VCOs, etc. are indeed important.
However, single-loop/fine-step PLL synths that have any reasonable
loop settling time for fast dial spinning have a fairly high
amount of phase noise. Only in low-cost CB/10m world will you
see such simple synths. This is why the cheaper HF rigs w/PLL
synths of a few years ago often had notorious "chuffing" noise
when you'd spin the dial. By having PLL loops with large steps,
the noise is spread over a larger bandwidth, effectively reducing
its localized effects near signals of interest. Even use of a
dual modulus PLL chip can't avoid this: we are dealing with
off-chip external design of the loop filters, etc. Major phase
noise contributor is the fact that digital circuits *ain't*;
they have analog characteristics. The programmable dividers
and reference dividers don't have exact 0<->1 crossover points;
different divider bits' flip-flops are slightly different from
one another, vary w/temperature, etc. [It is difficult to make
accurate chips.] So even a nice 100% "Grade-A" in-sync divided-
down reference signal and divided-down loop signal have some
errors during bit transitions that can pass thru loop filter and
get to the VCO.

Not all much money in the ham market. If they can make these
items as afterthoughts to their commercial items, great. That's
why you see so many VHF/UHF ham toys (HTs, mobiles, etc.)
around. Same basic radio but all sorts of frills. HF rig
market is costly to be in - far longer sales cycle, not a

lot of (if any) corresponding commercial HF business.

> CB radios are cranked out like dung through a goose in some Chinese
> sweatshop by some poor slob who makes $3 a day. Incorporating all the

> are low, carefully study the financials of Uniden. I think you'll be
> very surprised.

Yes, they are. Even much ham gear is mfgd about the same way.

Uniden is a large co. that prob makes fairly thin margins on
their CBs. It's the rest of their business that carries CB
along, with CB leveraging some of their distrib. channel,
parts supply, etc.

And if they were making so much money, their stock would
be way up there. Last business I'd wanna put my 401K money
into! I'll stick w/Cisco, etc.

cash money you asswipe 22 in Michigan was ruunning a davemade too haha You
are really showing you know nothing If you start selling another brand of
amp i guess they will join your ever growing list of the best boxes around.
. btw, X force is made by a bunch of white guys seeing as how you are
pushing amps made by some people of color thought you would like to know ..
what happened mr gunn turn you down? Or maybe he didnt give a discount

2070. Re: Alternator for 8 pill?

Newsgroup: rec.radio.cb
Date: 1999-12-17 00:00:00 UTC
From: Capt Coleslaw <8675309@aol.com>
Message-ID: <tZy64.173$MN.21661@news2.voicenet.com>
Source record: 15519

A good 200 amp leece Neville or equivalent would run the 8 pill at what ever volts you want. If you prefer to go the other route then a bunch of batteries either series or parralelled will make up for the lack of alternator power.

As the signal is modulated beyond 100% and the signal is switched between
being on and going into cut-off (no conduction), large amounts of switching
distortion occur in unbiased amps. This is clearly visible on a high
frequency scope. Amps that have a built in bias circuit do not exhibit this
to any where near the extent of the un-biased amps. Sean

*
*> Cleaner as far as switching distortion, but not cleaner
*> as far as harmonic and parasitic content or AM audio
*> signal quality since there is no information being
*> conveyed at the crossovers.
*
*BobC writes:
*
* There is a time when the rigs' carrier is going to be off during
*modulation when not limited to less than 100%. negative modulation.
****

The carrier in AM large carier modulated signal will always remain constant.
So
that portion of the AM signal will always be present at the input of any
amp.
Thus the carrier will always bias the base/emitter junction of the
transistors
at a constant level.

regards
james

****

* Not unlike SSB, when the drive gets below the turn on voltage of
*the finals there will be no conduction in the transistors. When the

*drive starts to rise, it must pass this breakover voltage to get the
*transistors conducting again. At this point you have crossover
*distortion as Sean said.
* So, in essence, there is a part of the information lost in the
*crossovers when not biased right.
* BobC
*

Personally, I would take most ham rigs over many CB rigs. Just due to the cheap designs of the CB radios. Personally there is no CB or quote 10M rig slash CB rig that is worth over $200 brand new. Even the most expensive EXport rig has probaqbly less than $50 total cost in manufacturing it. I would not be surprised if the markup on these rigs fromth emanuafacturer is at least 200 percent or more.

The carrier in AM large carier modulated signal will always remain constant. So
that portion of the AM signal will always be present at the input of any amp.
Thus the carrier will always bias the base/emitter junction of the transistors
at a constant level.

Newer designs are also moving to zero-voltage switching or
zero-current switching. This could be a reason that they are less
noisy.

Let me put things into perspective, Skipp. I've designed numerous power products and many electronic circuits. These designs have not won awards but they've sold successfully for the past six years - and are still very much current (no pun intended). Let me also put something into perspective. If you've ever used a cellular phone you've almost certainly benefited from one of my company's products.

I haven't the time to educate someone, like yourself, who already knows it all. I suggest you bone up on your SMPS theory.

MC

PS: Shielding is only the beginning of noise suppression. Try and think outside of the box - within the box.

I'm curious as to why you think the carrier is constant when
there is applied a large negative going voltage swing from the
modulator. I reference this to a hi level modulated rig wherein a
transformer is used and the peak audio is not limited to less than

100% negative going modulation?
I say the applied audio voltage is able to negate the collector voltage for a length of time based on the degree of overmodulation in the negative direction.
This is pretty obvious if you look at the scope while reaching 100% and worsens as the audio voltage is increased. If you do this you'll see the carrier is off for quite some time.
Another point to make here is that when the carrier comes back up in amplitude it may have a pretty fast risetime (resembling a squarewave ramping up) which will create an undue level of harmonics and trash.

This type of activity with linear amps is mostly caused by low dead key. Try raising the dead key of the radio a 1/4 of a watt at a time this should cure your problem if your talking on AM. However if your talking SSB then this is probably normal. In SSB mode it should click when ever you talk into the mike and after.

It requires a soundcard and Internet Explorer 4 or higher. I've been talking on it for a few days and *LOVE* it. I just wich I could hook my old Palomar to my computer too ;-)

http://virtualcb.cjb.net

An old friend of mine told me about it last weekend... I went to the site, downloaded the plugin, and talked to him for the first time since he moved away 4 years ago!

Anyway, I thought you fellow radio buffs would get a kick out of this.

Cheers,
Chopper

You have it almost right. Most Hams don't care what you do on your
frequencies, but we "do" care what you do on ours. I've been QRM'd by CB
AMers and SSBers running mega-watts many times while trying to conduct a QSO
via CW in the Amateur portion of 10 meters. Remember that respect runs both
ways.

2133. FS: 2 RCI 2950s

Newsgroup: rec.radio.cb
Date: 1999-12-18 00:00:00 UTC
From: "John J. Gervasi" <jgervasi@bellatlantic.net>
Message-ID: <385BB4BB.5B69BEC1@netscape.net>
Source record: 15582

I have two RCI 2950s for sale.

#1 - R285 has been replace with a diode and 100 Ohm resistor. This radio is setup to dead key 1W and swing to 16W with 100% modulation. I can remove this mod no charge if you perfer which would make it a stock 2950. I can setup the radio any way you want (assuming your request is within the operating parameters of the radio design). $125 with stock mic plus shipping.

#2 - Same mod as above plus Q52, the AF final driver for modulation, has been upgraded to a higher power transistor. This radio is setup to dead key 1W and swing to 18W with 100% modulation. I can remove the swing mod for no charge and setup the radio any way you want (assuming your request is within the operating parameters of the radio design). $140 with EMC Echo mic plus shipping. ($115 sans the echo mic.)

The radios can been seen if you are in the Metro Washington DC.area.

John

the 2x6's, and 2x4's that are being built are being driven by 2-2290's where as a 3 pills drive is proportional to the 2x4, 1-2290 for every 2-2879's. you don't think the 3 pill is being driven to much do you?

I don't think the 3 pill is to much for the 8 pill, that is 1-2879 for every 4-2879's less than the smaller driver amps use.

Sean it could work with a standard 50 ohm line section Bird or coaxial dynamics,
it could use a single or dual element, the single would of course not give you the swr computation since the meter would not have the reflect watts to compare it to.

Also, there is a jack that allows you to parrallel your standard bird analog meters with it to read the forward and reflect power on the analogs as well as the digtal at the same time. This is good for those who still like to see the needle swing on thier bird meter, along with the ability to see the faster response time of the digital meter.

I would like to know why swing is good. Why is deadkeying 1 watt and swinging
15 watts better than deadkeying 5 watts and swinging 15 watts?
I would think the higher the watts the more power you would have. Why would
you want to deadkey next to nothing and swing so much?

I'm going to try explaining this in simple terms.
Am modulation it the difference between the peek envelope power and the carrier power. What do you think is a greater value 15W pep - 1W carrier, or 15W pep - 5W carrier?? If you can do simple math you will see the lower dead key gives you more modulation!! This often makes your radio some loader to your locals but choppy in DX.

its a good buddy goober smoocher thing. they like to see the meter swing. it doesnt really do anything. the carrier should be set at 1/4 the peak output of the radio. any lower and it sounds like crap to any radios with noise blankers on. some people do do it for a good reason, there trying to save expensive sweep tubes so they set the carrier at less.

Tim you are saying it doesnt do anything? , It increases the apparent loudness to the recieve station, I myself prefer some carrier and 25-50% of the total output is what I use for a carrier

What gives with the pulse tone on this freq. This used to be a great dx freq with some great operators. I have not had my radio on for a few months(its a work thing) and now that I do this noise does a good job of shutting down most of the communications. Does antone know anything about all of this???

Tim, I guess you are also familiar with the term "Dick Rider" You do alot of it Do you recieve anything in return for your advertising for the 11 meter DX news, or the other DX groups you list everytime you post. Does that make you part of their Crew? Does that mean I cannot root for Ford over Chevy without being a major shareholder of either company? He likes his davemades as much as you like your dx groups or talking on ssb. Its what ever your into. I have read much better DX news reports, yours is not the best around maybe yours is only good for cbers and freebanders.

Low dead key.
Low power to the amp (small wire, bad connections, bad ground).
Bad coax cable.
SSB (push in SSB button to engage delay).
High SWR.

Hello Station53: The Pride uses a 4CX250 or 4CX350 tube. And can put out 500 or more watts depending on what you drive it with. It is a AB1 class amp. I bought one for $350 and had to replace the tube for around $125 dollars, but it certainly cranks. The tube will out last the sweep tubes by years. I saw one on E-bay go for just over $400 dollars and it was tore apart.

While I realize that this is not actually "radio equipment", I'd like to offer this equipment for sale or trade:

I have a Biamp (brand name)60 watt power amp and a Biamp "Advantage One" 8 channel microphone mixer for sale or trade.

Both are rack mount units. The amp was last used by a friend as a guitar amp to drive a speak for a recording session. Would make a nice small p.a., guitar amp, or perhaps monitor amp. The mixer was used to mix a set of drum mics down to a single channel for recording.

Will sell for best offer plus shipping (UPS about 15 pounds) or trade for ??? My interests are in ham, SSB CB, scanner, or musical equipment. Make me a reasonable offer.

Please respond by e-mail. If posting here, please send me a copy as I don't read the groups every day.

Thanks.
Jim, W8EMS/9

It's a waste of time. There is no advantage going over 100% modulation - plane & simple. Decreasing your carrier power will decrease your range - period. One thing to keep in mind that the carrier exists to demodulate the side-bands at the receiving end.

Why do people do it? Because it makes them sound LOUDER locally.
Many Psychological questions come to mind here.

Although illegal they are OK for a bare bones el-cheapo as long as you can get one at or near wholesale($310+shipping).They seem to make a big deal out of it having a power supply built-in,but all base amps I have seen come with a PS,thats what a base amp is.

Sorry MC this is not the case decreasing your carrier power in no way reduces your range. A reduction in carrier power has no bearing on total output power Let me ask you this lets assume we have 3 of the same amplifiers each capable of holding with audio 5oo watts rms power on am, Amp "A" is keyed up at 200 watts of carrier and modulated to 5oo watts of rms power, Amp "B" is keyed up at 500 watts and when modulated holds 500 watts of rms power , Next Amp "C" is keyed up at 800 watts and is modualted back to 500 watts Which would have the greatest range or if all three keyed up at the same time which would be heard over the other and Why?

Many truckstops sell a little external talkback kit that plugs into the external speaker and PA jack (2 wires). You then plug your external speaker into this external kit, which usually has a dial on it to control loudness.

Performance is marginal at best, but if you're looking for a cheap external fix, about $12 will get you one of these.

If a cable ready TV or VCR is set to receive cable, It receives a whole new range of frequencies on VHF and UHF. Some are even in the FM broadcast band. If you ever notice bad herringbone interference on channels 95 through 97, It is usually caused by ingress from a strong FM radio station. Go to: http://members.tripod.com/silatvg/cable.htm to a partial frequency list used to carry cable channels.
You can also vist http://www.ac6v.com/pagew.html#A for a lot of info on fast scan (regular NTSC Standard) amateur tv.

it depends on what type of radio you have, like a cobra , for example. You could either (1)internally solder a 100 ohm resister from your PA joint to your Ext. speaker joint, and recieve talkback, or(2) you could wrap a piece of wire around your external speaker jack plug, and fasten the other end of the wire to one of your radio cover screws, and plug the ext. speaker in to its proper hole, and recieve talkback that way also. (like I said this depends on the type of radio that you have).

Here we go again. Anyone can go to nearly any frequency and listen, but you don't transmit. CBers don't give a rat's ass where they transmit. An amateur can and will lose a license if they are out of band and there is plenty of legal spectrum.

"Swing Kit" - Exceeds 100% modulation on the positive modulation peaks (easily demonstrated on a "scope"), positive modulation peaks can and more than likely will exceed 100% modulation without producing distortion. This in fact increases the amplitude or power output of the CB.

Swing Kits will increase modulation......which in turn make you seem louder.....and despite this argument of due to lower carrier....etc....etc.... I have a question for all of you I suppose.... who the hell hears someone's carrier when talking skip?!?! Just a question....

Take care.... Im gonna feel the love on this post..

The mods for the newer ones are easier. There is only on jumper to move and then add one in the previous spot or short it with solder. With this mod you get 26-32 band coverage.

What the deal is......That amp comes with a built in power supply that can be used to power up a 13.8v device. You are a little off on this one my friend. You are thinking of the internal PS that is used to power the amp.....the PS in this unit can and IS designed to power external equipment also!

I'd call it simple backswing, reflect watts resulting in burned radio and box.

But correct me if I'm wrong. Has anyone heard of the "see-saw" effect? The more the swing, the less the modulation? The lesser the swing, the more the modulation? Or have I been out of the loop (or totally out of it for the past 8 years) and should be told to go sit in the corner now?

137... back out!

You have a decent radio there. The power is not great but most
adequate. The modulation is very good when the limiters are either
adjusted or removed.(your choice)
The only problems I ever saw from them was the PLL out of lock
switching transistor would sometimes go bad and cause the radio to
rcv or tx intermittently. I seem to remember this transistor would
cause the tx to stop when modulated.
You could put a few extra ch.s in this radio pretty easily. I
think it went to something like 27.585 or somewhere thereabouts. I
think it also went a few ch.s below one as well.

Source record: 15650

I asked this once before but I pulled both deals(The protection diodes is what they are called I think) off the + and - right inside the radio and checked the ohms on them both ways and it was hi both ways on both the Pos. and Neg. The power was hooked up backwrds at one time and hasn't worked since. When I hook up the power wires I also have no power at the inside of the radio on the pos and neg poles before the diode things. Any help would be great. I have no good CB shops near me(Closest one is 2 1/2 hours away) Any help would be great. Also, Is there a Radio Shack replacment number for the protection diodes if that is what is bad? Also, What else should I look for if any and how would I go about testing it? It is an older 148 without the SoundTracker.

Thanks in advance.

Correct, we also look at the past few month's of activity to get an
idea of what *may* happen in the future. This cycle at the moment
looks as though it may be an average cycle, nothing spectacular.

> Anyone(including scientists and the ARRL)who tried to predict the
>cycle before it was even 1/2 way to peak was a fool.

Pretty much. The Sun is still a mystery pretty much. There is a lot
we know and a lot we don't know. That's what makes it so interesting
and fun to study.

> I predict a very weak and low peaking cycle,much like those of the
>Maunder minimum,I could be wrong.

It won't be weak, probably average as things look right now.
Certainly not another Maunder minimum.

Just got this radio and tested it out (stock). On a DOSY, it deadkeys at 2.5 watts AM and swings to just under 4. This seems to be under product specifications (4 watts peak AM/FM). PEP on sideband maxes out at about 3.5, again under specs (6-7 watts PEP). Also on LSB, deadkeying gives about .5 watts instead of 0. Probably a mis-balance somewhere. Did I just get a dud? or has anyone else experienced this with this radio?

Thanks
-RC

Quite frankly, it was worded so poorly, and based on 'magazine logic', I didn't even try and deduce any intelligence out of it. (Much the same as an AM receiver can't deduce any intelligence out of a signal when there is no carrier present). And this is/was/shall always be my point. -Swing- is a nonsense term and one can't make any hypotheses from an equation containing nonsense. I simply refuse to 'go there'.

Have a good evening and may Santa Claus bring you lots of toys!

Go to a truck stop if you don't want to mail order it. I see them for $140 to $160 regularly. On the other hand, some shops sell them at a higher cost and include their version of a peak and tune. Ask if that's the case to see if it's something you need and whether it's a deal or not.

Scott's suggestions are all valid, but there is one that he left out.

Most "export" or ssb radios produce a square wave when they are fully modified. The abrupt drop off in signal can sometimes cause the keying circuit to chatter the relay, even though there is plenty of drive being applied. If this is the case, you need to add some capacitance to the keying circuit to correct this. Sean
>

Scott (Unit 69) wrote in message <385BF11D.E75AF0FE@hotmail.com>...
Low dead key.
Low power to the amp (small wire, bad connections, bad ground).
Bad coax cable.
SSB (push in SSB button to engage delay).
High SWR.

Decreasing your carrier DOES reduce your range IF the average power is also lower under fully modulated conditions.

Some radios can produce the same average power whether set for a 2 watt carrier or a 5 watt carrier. Other's can't. Whichever one maintains the highest average power and can fully modulate the envelope (and then some) will get out the farthest. Sean
>

Capt Coleslaw <8675309@aol.com> wrote in message ...
Sorry MC this is not the case decreasing your carrier power in no way reduces your range. A reduction in carrier power has no bearing on total output power Let me ask you this lets assume we have 3 of the same amplifiers each capable of holding with audio 5oo watts rms power on am, Amp "A" is keyed up at 200 watts of carrier and modulated to 5oo watts of rms power, Amp "B" is keyed up at 500 watts and when modulated holds 500 watts of rms power , Next Amp "C" is keyed up at 800 watts and is modualted back to 500 watts Which would have the greatest range or if all three keyed up at the same time which would be heard over the other and Why?

MC 10kW Jesus <qsl27@hotmail.com> wrote in message

Birds (peak or rms) don't read correctly in the fact that they don't typically show the " 4 times" ratio that is theoretically correct when talking about peak to average ratios and 100% modulation. # 12's peak detector works better than Birds' circuit does and it's what i use a reference on my bench.

It was #12 that pointed out to the Bird Engineers that their circuit suffered from compression and caused them to redesign it appr. 1 1/2 years ago. Bird did not advertise the fact that their design was "new and improved", as that would have been admitting that it wasn't right in the first place. I pointed this out to Meritt, the owner of RF Parts at the 1998 Dayton Hamfest and showed him the differences between the two circuits. Even he did not know that it had been changed. Sean

2260. WTB/WTT: compactron and novar sockets

Newsgroup: rec.radio.cb
Date: 1999-12-19 00:00:00 UTC
From: ovrreactor@aol.com-nospam
Message-ID: <19991219051854.04179.00000145@ng-cf1.aol.com>
Source record: 15679

Like the subject heading says, I'm looking to buy (or trade for) good compactron (12-pin), and novar/magnoval (big based 9-pin) sockets. No PC mount, please! Looking for reasonably priced saddle mount , small or large quantities. I want to start playing around with my stash of compactron triple triodes and my sweep tubes.

Let me know what you have, what you're asking, and (in the case of a trade) what you're looking for. I have tons of neat-o stuff, a miniscule portion of which is posted at;

http://members.aol.com/Reactor001

If you don't see anything you like, just ask...it's probably stashed in a box out in the garage.

Respond by email, please.

Regards,
Tom Mitchell
email - OvrReactor@aol.com

2261. CB That Scans

Newsgroup: rec.radio.cb
Date: 1999-12-19 00:00:00 UTC
From: twhite8611@aol.com
Message-ID: <19991219060703.12385.00000095@nso-cg.aol.com>

Check our local Radio shack too. They used to have one. They don't have a high performance rating. But if you are looking for looks and savey then there you go. It will get you down the road, you will be able to hear local information and road conditions. You might be able to hear skip given the right conditions.

Make sure it is tuned after you install it. That will net you the best results given then circumstances. Also check you local CB Shop. They might have one in stock too.

Careful son. When a Hamster or a CBer goes "out of band" they then become a Freebander. Where they came from is not really relevant anymore. There's probably more freebanding going on than you imagine. I know of other frequencies well down in the SW spectrum where a host of illegal freebander operators run QSOs between the USA and Middle East. You just don't know what they're saying so you assume it's official business.

Sorry Coleslaw, it is. Hank Aaron (didn't he play baseball???) noted that swing kits exceed the 100% modulation envelope on the upswing - this is exactly what AM broadcasters do too. This with plenty of compression on the signal (applied not evenly but across different parts of the audio spectrum) and the station will sound louder. Transmit farther? I've seen no evidence of that.

Whether the the swing kits really do the same thing or not I don't know. But I suspect users run them on radios with the modulation limiter pulled anyway and therefore negate the whole exercise.

> up at the same time which would be heard over the other and Why?

So if one train leaves Chicago going west at 45MPH and the other east at 30MPH.......

I don't really understand your question but the amplifier with the greatest carrier power is going to talk the farthest - assuming you have 100% modulation.

If you're over modulated, which in your case you are, there is going to be a large part of the carrier that is transmitting nothing at all. How nothing can be more powerful than something is beyond the grasp this author. I encourage you to run as much "mawj" as you want. I'll be the one making all the contacts across the world, and you'll be the one making all the noise across town. :->

1.) I would "guess A" because it has 300 watts of positive peak modulation.
2.) I wouldn't "guess B" because it has no modulation :ON AMPLITUDE MODULATION THAT IS IT WILL BE GREAT FOR FREQUENCY OR PHASE SHIFT MODULATION.
3.) I wouldn't "guess C" because it has Negative Modulation.

I am not an Rf expert but this is the results of simple AM arithmetic.

"Capt Coleslaw" <8675309@aol.com> wrote in message news:RPT64.83$G31.8805@news2.voicenet.com...
| Sorry MC this is not the case decreasing your carrier power in no way
| reduces your range. A reduction in carrier power has no bearing on total
| output power Let me ask you this lets assume we have 3 of the same
| amplifiers each capable of holding with audio 5oo watts rms power on am,
| Amp "A" is keyed up at 200 watts of carrier and modulated to 5oo watts of
| rms power, Amp "B" is keyed up at 500 watts and when modulated holds 500

If you read his question you would know none of the choices have 100%
modulation>
1.) Choice "A" would have to swing to 1000 watts for 100%
2.) Choice "B" has 0%.
3.) choice "C" is keying up with 800 watts and dropping down to 500 Not
good!!

its called backward swing. you would rarely see this on the peak meters that so many cb'ers use. if a amp is putting out more than it should on am and isnt left with any head room you will see it back swing. thats why so many guys sound raspy and muffled. they may have there box on a peak meter thinking they have all kinds of swing when in reality on a rms meter there backswinging and sounding like shit.

Time to chime in here a bit. I have used both a normally modulated carrier and a carrier with positive modulation via a swing kit. The real advantage is when driving an amp. Remember, you can only hear the differences between the carrier and the modulated signal. In order to detect AM you need this difference and the greater the difference or PEP, the louder you sound. Most amps are not linear in fact, if you look at the power curves for most amp transistors there is usually a small range over which the transistor is truely linear. So, if you just slightly over dirve an amp you typically end up with modulation compression. The way to solve this problem is to minimize the dead key and swing 6 to 12 times the dead key. I have seen a 2950 dead keying at 1W and swinging to 16W driving a TX 667V from 80W to 300W. Not very linear is it :-) But the detectable signal is superior. Of course, if you over drive the amp with too high a drive you still get compression and that choked sound. Hope this helps.

John

i will sell you a bracket for a chevy . you can use 5 leece neville's with a/c or 8 without it. the price is $600.00. that includes the bracket only. you furnish the alternators and bolts, etc. i suggest grade 8 bolts for alternators. the way it works is that direct drive is applied to three alternators in the middle and you figure out how to drive the others. some people use indirect drive with double pulleys or some other configurations. this bracket is for use with chevy bolt patterns, say about 1987 or 1988 to 1991 , i think. this is for serpentine belt also. this is my own design, and i didn't copy from anyone else. thank you , thank you very much,........icm out....

Body handling: HTML body converted to readable text

I am going to use velocity to prove a point since it is much easier than Rf
AM modulation. Please note the concept is the same~

(A)----------(B)

Point T1, X1 = (0 Sec,0 Ft)
Point T2, X2 = (10 Sec, 10Ft)

Average velocity = Delta X / Delta T (right?)

now if you go from point A to point B and back to point A what is your
average Velocity?

Answer: 10Ft - 0Ft / 10 Sec - 0 Sec = 0 Ft/Sec

Are you telling be he didn't move?

Average is not very reliable.
You need to know calculus to find the Instantaneous values of Velocity.

That is where my $60,000 education came in to play!

The confusion in this conversation would be in the wattmeter's, What transmitter are you saying will do 50 watts? Most of the time when someone claims that their radio is doing 50 watts it is hard for me to believe. To make this question easier to answer, my question is this, What radio or amplifier do you have in mind?

Dear Timmy boy:
The story you just told makes no sense at all. There is not enough head room? What Book can I find that statement in? LOL
Let me explain the most common reason of over modulation or "raspy and muffled sound".
When people over modulate is has nothing to do with the size of the envelope signal. There cause is when you drop your carrier so far that the Negative Peeks approach the Zero (reference line on a scope) you will see that your negative peaks are flatting out at this zero mark or in other words the negative peaks are being clipped off.
You can key up 500 watts and swing to 10,000 watts this amount of swing doesn't make you over modulate if you have the proper equipment to give you that much swing.

#1Run a wire from the large post (+) on the alternator to the (pos) screw
on the regulator

#2Run a wire from (F) on the alternator to (FLD) on the regulator.

#3Run a wire from a good ground on the vehicle to (NEG) or (GND) on the
regulator.

You might prefer to run positive wire (#1) to the battery bank instead of
to the alternator, for safety sake don't forget fuse's

Could only find an 80A model?

Found another SMPS Co @

http://www.duracomm.com

that DO advertise a 100A unit!

Just heard of a company called 'Luke' but my multiple search engine
found a big zero.

Phil / UK

2351. Yagi antenna modelling for max gain ?

Newsgroup: rec.radio.cb
Date: 1999-12-19 00:00:00 UTC
From: phil <phil@invest.fsbusiness.co.uk>
Message-ID: <lWZnXfAJOTX4EwVf@invest.fsbusiness.co.uk>
Source record: 15800

Does anyone on the ng have a copy of 'Yagi Max' or similar software to hand?

I have EZNEC but would like to see what figures other people come up with.

The project:

To optimise a Hy-Gain/Telrex 5-element Long John horizontally polarised yagi antenna mounted one wavelength above ground for maximum forward gain on 27.025.

Front to back and side rejection is not important.

The factory quotes a forward gain over a dipole of 12.7db but this was in the days before anyone modelled on computers and taking into consideration f/b and rear rejection.

The boom length is 24ft for those not familiar with this antenna.

I want the antenna optimised for 27.025.

The beer's on me for the first person with some element length and spacing numbers.

Thanks

Phil

> forbid this guy goes and buys 8 or more batteries.....

I agree, the mo batteries, the more current draw on the alternator
required when "charging". Now if the guy runs his regulator at the exact
same voltage his batteries are at "cold" then it doesn't really matter,
But everyone knows that this is not the proper way to do things and each
battery should be considered as another "load" on the alternator. I am
sure this will be disagreed by a few, but that is the way I do things.

Boo I like to think the Amps are a load on the batteries. The alternators are just there to keep filling the batteries. It is the same concept with capacitors they are often used to be a voltage bank so the load doesn't draw from the main source in this case the alternators.

This is just my theory It sounds god to me.

The right price to anything is:
1.) The price you are willing to pay for something.
2.) Not a price higher then the average going price of the same item in the same condition.
3.) Lower on used Items as in reference to the same item brand new.

VOLTAGE IS A POTENTIAL DIFFERENCE;
water and electricity act the same way...

Let me give you a simple example. When you go to get a drink of water are you draining from the river or the water companies supply?

The river is the alternator.
The water companies supply is the battery or capacitor bank.
The amplifier is just taking a cup of water.

You guys think to hard. Break your problems down to simple concepts and they will appear much simpler to understand.

It is obvious that if the river isn't big enough for the water company to supply the whole town you will see some voltage drops. You are not going to dig a bigger river you will build a bigger water company supply bank right????

This is the same case as an alternator and battery system!!

I would like to see how long that "8 pill" will last.......When you wire "a bunch of batteries" in parallel. In case you didn't know, voltage increases when you do this.
(you CAN'T run an amp at 24v+ for very long, and it gets pretty expensive replacing transistors!!)
.....Run your Driver on the vehicles electrical system (13.5~13.8v) Run a 100a alternator, in the stock position~with the biggest battery that wll fit under the hood.
Next, run a Leece/Neville 130a alternator (custom-mounted), with an external voltage regulator.(adjustable 12~24v).
I don't know what your setup is, or what kind of vehicle you have......Just make sure you're running at least 2ga. power cable, with a good ground......And MAKE SURE everything is fused!!
.......Maniac

I dont believe I would be so conceited to say I was a RF expert myself... however, I -DO- know I make mostly educated and EXPERIENCED comments.......replies.....etc..

So, to this, I believe you are in error when you say "the dumber you guys seem to me." Or at least I am said to say that you have not really matured then my friend.... With maturity you will realize how much you have to learn, rather than how much you think you know of electronics in general.... Now, if you were in error (from a quick post, whatever) and accidentally wrote "you guys," which is comparable to SOMEONE saying "all CBer's run illegally" then okay.... clean slate.... other wise, this post and the above statement of mine remains....

prozac 625 wrote in message ...
|When I first came out to the NG I felt really stupid. No seriously, I
|thought you guys where Rf experts and knew everything. The longer I hang
|around this place the dumber you guys seem to me. You guys are twisting
|facts making up shit that makes no sense and all kind of shit.
|
|YES IT IS TRUE THAT: I'm not an Rf expert, I don't know everything there
|is to know, and I do make mistakes. But even when I'm wrong I am making
|educated attempts. You guys just blurt out shit when you have no Idea what
|you are talking about.

Has anyone had any problem with Exports R Us lately ? I have sent some stuff in to be repaired and turned up and it has been at least two months. I have been getting the same run around , yeah it will go out this week. Well needless to say, NOTTA.
Well I guess, maybe Santa will bring it to me on his sleigh.
Their sales and service used to be good and fast , are they slipping ?
Tinker

>
> 137... back out!!!

The reason said I did not understand was because I can run say an 8 pill box @ 19 volts, keying 2500 and swinging down on a bird 43 and my reflect is only a couple of watts @ the antennas. The input reflect on the amps is real low as well. See this is why I said I did not understand.

Picked up one of these , a while back,export model,in and out of a couple local shops , oops the 477 finals been changed ,to a wimpy one , kept sounding like crap on sideband, not sure what they put in , more of a 5 watt thing,could have bought a new radio for what I've got in this one , seems to work ok now , takes about 10 minutes to warm up for sideband stabilization, spose its worth putting a stronger final back in if I'm going to keep it or were these just a pile of crap radio ???? its one of the older models ,

Do some testing and see if more batteries are better, break out your dc current transformer and take a current reading on the wires feeding the batteries from the alternators, then take a reading between the amp and the batteries you will see a little more current draw between the alts and batteries, even if you are charging .5 volts above battery voltage, now increase the voltage to say 2 volts above the batteries and see how much the current draw increases at the alts over what it is at the amps, also note that there is still a load on the alternators even after you unkey, the more batteries you add the more current draw on the alternators. Now if you do not have enough alternator and are pulling down to battery voltage then you will see the voltage drop less with more batteries, But it will only wear your alternator out sooner by adding more batteries unless you charge right at battery voltage. If your alternator is just barely big enough to handle the job and it works fine with say one battery and you go in there and add 6 more batteries you will see less watts, now all of this is assuming the system is "truly" wired with enough conductor on both positive and negative sides of the system from the alternator to the amp.

Now this my "simple example" and it has a very "simple concept" its called time tested truth, and not to be a knowitall but I will stand behind this one until the end.

Now why would that be? I mean, why would you want to key so high and swing down? I'm just curious because wouldn't the modulation of your audio be "choppy" or to the point of almost broken up? Out here in the Mohave, I've seen some readings back swing from the Mag, Smokey Hills and other places and the audio is real crappy. Why?

Besides, I believe and know that a properly tuned antenna system will cause low reflect to the amps. But why would you want to key that high and swing down? Makes no sense...

Power = amps times voltage
You have to specify the voltage. Probably 12V.
50/12 =
300/12=

Sears Roadtalker 40 base station, AM,USB,LSB, very good condition,
works 100%, comes with stock hand mic, asking $100.00 + $12.50 for
priority shipping.

Radio Shack TRC-207 40 channel, 5 watt walkie-talkie, green LED read
out, rubber dukie antenna, works very good, batteries not included.
Price $22.50 + $5.00 for priority shipping.

Radio Shack TRC-221 40 channel 5 watt "TOP OF THE LINE" walkie-talkie,
LCD readout signal, batt., power meter.
Telescopic antenna, has jacks for; speaker, ext. mic, ant, chg, pwr.
This unit sold new a few years ago for one hundred and fifty dollars. It
is in MINT CONDITION !! used only two times, and then was put in
storage. Works 100%. comes with box and owners manual.
Price $65.00 + $5.00 for priority shipping and Postal insurance.
Batteries not included.

If interested, please contact me at; max_it_out@webtv.net
sorry no C.O.D.`s or checks
U.S. Postal money orders only.

2430. Re: watts vs swing

Newsgroup: rec.radio.cb
Date: 1999-12-19 00:00:00 UTC
From: Miles Davis <MDD327@aol.com>
Message-ID: <83kn5msvs1@nnrp02.primenet.com>
Source record: 15879

Tim! You win the grand prize! Headroom is the key no matter what meter you are using. The device(s) can only do so much. Exact tuning or swing kits(!?) alter the ratio of carrier to forward modulation or swing in a given amount of "headroom". I rarely run my radios higher than 25% of the peak output. Why make the radios do all the work when those things behind you have heatsinks? If you need more watts add a stage. If that is not possible then add a driver.

--
This is CB radio.....No crying allowed!

From: dkdk@dfkdk.ccc
Message-ID: <MPG.12c773578edd1974989837@news.earthlink.net>
Source record: 15882

In article <385DB227.A8242CB5@jejr.com>, kjfdskdj@jejr.com says...
>Power = amps times voltage
>You have to specify the voltage. Probably 12V.
>50/12 =
>300/12=

Okay, so I can run a 50 watt amp off of
6 amps or not? I can't seem to get a
straight answer on this. Does anyone
know? You're saying that I can run
a 70 watt linear off of a 5 amp
linear? 50Watt / 12Vlt = 4 (approximately)
It still doesn't sound right. let
me re phrase the question: If YOU were
running an old 50 watt linear and you
wanted an AC to DC converter to run
it (amp only), how many amps would you
need to use? A lot of you guys seem
purdy knowledgeable about this but
no one seems to be able to answer
a simple question!!!!

I guess I should just forget about it!

Yes, it actually is that easy...
I don't know which newsreader you use, but there should be a selection under preferences or options that will allow you to filter or ignore posts and/or email from certain parties. Just enter the email address or screen name that you want to ignore, and you will no longer see their posts. A lot of the newsreaders will replace their post with a <plonk!> Of course, if they change their name (or email address) you will see their posts again - however, a quick update to the "ignore" list will remedy the situation ;-)

I have two questions for you before I decide on which antenna to buy
.
#1 - is the I-MAX 2000 adjustable for swr's? if so how is it tuned ,
and
is the MACO V-5000 adjustable for swr's? if so how is it tuned
#2- Also, In your opinion , which is the better antenna for the 11
meter band?
It will be mounted on the roof and be hooked to a GALAXY SATURN base
station.

Thank you for your time,
Rafterman

Set the switch to the calibrate position. Key up the microphone with no modulation and adjust the knob until the needle is on the calibrate mark, then relese the microphone and position the switch to swr and key the microphone and look at the reading. If it is higher on 40 then shorten the antenna, if it is higher on 1 lengthen the antenna.

Boo is right. The alternator system needs to be able to supply ALL of the current with no sag at any time. The batteries are simply buffers that CAN bog down the system IF the alternators can't keep up with the demand. After all, even after you turn off the faucet, the river still has to fill the storage tank that you just depleted.

More alternator with less battery equals lower maintenance, less chance for boiling over or explosions, damage to one's self or the vehicle from fumes, less weight and wear and tear on the motor / trans, better gas mileage, etc... The alternators only produce as much power as needed on demand.
Sean
>

-=PEAKABOO=- wrote in message <83k29s$q91$1@nntp8.atl.mindspring.net>...
Do some testing and see if more batteries are better, break out your dc current transformer and take a current reading on the wires feeding the batteries from the alternators, then take a reading between the amp and the batteries you will see a little more current draw between the alts and batteries, even if you are charging .5 volts above battery voltage, now increase the voltage to say 2 volts above the batteries and see how much the current draw increases at the alts over what it is at the amps, also note that there is still a load on the alternators even after you unkey, the more batteries you add the more current draw on the alternators. Now if you do not have enough alternator and are pulling down to battery voltage then you will see the voltage drop less with more batteries, But it will only wear your alternator out sooner by adding more batteries unless you charge right at battery voltage. If your alternator is just barely big enough to handle the job and it works fine with say one battery and you go in there and add 6 more batteries you will see less watts, now all of this is assuming the system is "truly" wired with enough conductor on both positive and negative sides of the system from the alternator to the amp.

Now this my "simple example" and it has a very "simple concept" its called time tested truth, and not to be a knowitall but I will stand behind this one until the end.

I'm gonna' fire up the crowd and say that I think the Firestik KW-7 is the best antenna for the money. I have talked anywhere I wanted to. Coast to coast with a two pill. I always keyed on my buddy who had a 7 foot Skipshooter. They looked identical, but they don't act identical. And the Firestik costs less last time I checked.

Storm wrote:

Since the average power remains the same in all circumstances, i'll take the easy way out. Whoever has the best antenna system wins :)

Actually, the guy with the biggest peak would be the loudest. Since waveforms from radio to radio differ so much, it is impossible to tell given this example. Sean
>

DriveByShooter > wrote in message ...
Sean that was the point in all of the examples the avg power was 500 watts, they all just had a different deadkey. Which would you assume would be the louder of all 3 situations? Since MC ducked answering it.

What you think of idea of realization of radioexpedition on Southern Altai?

Southern Altai - highland is on the board of Kazakhstan, Russia, China and Mongoly.
Land of lakes and waterfalls, mountain taiga and stormy rivers, deserts and snowy peaks...
In time of Soviet Union this territory had been absolutelly inaccessible for foreign tourists (and furthermore for radioexpedition) - in locale
It is not enough of ham stations.

The base camp of expedition is planned to place in region by highest Fastigiums of Siberia and Altai of a mountain Belooha, lake Markakol and Zaisan.

If you were interested by our proposal, we can be found on ranges 21Mhz, 28Mhz call sign UN8JZZ (collective radio station)

2473. What SSB radio to buy - <$150?

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: aellery@aol.com
Message-ID: <19991220033237.15001.00000039@ng-fx1.aol.com>
Source record: 15922

I've decided to take the plunge and get a SSB radio. I was ready to order one of the reconditioned units (Grant XL - $132)) from the Uniden web site and then decided to do a little web surfing. Now I see that there is a Grant LT and at least one Cobra model that fits my price range. Any recommendations to a newby as to what to buy and where to buy it? This is my first CB besides one of the GE emergency units and I'd rather spend the money now than to have to upgrade from a pure AM unit later.

2475. Re: Please read this whole message!

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: Hank Aaron <jeffherrings@mindspring.com>
Message-ID: <83kqq8tlk1@nntp2.atl.mindspring.net>
Source record: 15924

I'll take credit of TRYING to point that very fact out awhile ago....

Watch out Sean, dont want to get accused of "dick riding".... <g>

Sean wrote in message ...
|Boo is right. The alternator system needs to be able to supply ALL of the
|current with no sag at any time. The batteries are simply buffers that CAN
|bog down the system IF the alternators can't keep up with the demand.
After
|all, even after you turn off the faucet, the river still has to fill the
|storage tank that you just depleted.
|
|More alternator with less battery equals lower maintenance, less chance for
|boiling over or explosions, damage to one's self or the vehicle from fumes,
|less weight and wear and tear on the motor / trans, better gas mileage,
|etc... The alternators only produce as much power as needed on demand.
|Sean
|>
|
|-=PEAKABOO=- wrote in message <83k29s$q91$1@nntp8.atl.mindspring.net>...
|Do some testing and see if more batteries are better, break out your dc
|current transformer and take a current reading on the wires feeding the
|batteries from the alternators, then take a reading between the amp and
|the batteries you will see a little more current draw between the alts and
|batteries, even if you are charging .5 volts above battery voltage, now
|increase the voltage to say 2 volts above the batteries and see how much
|the current draw increases at the alts over what it is at the amps, also
|note that there is still a load on the alternators even after you unkey,
|the more batteries you add the more current draw on the alternators. Now
|if you do not have enough alternator and are pulling down to battery
|voltage then you will see the voltage drop less with more batteries, But
|it will only wear your alternator out sooner by adding more batteries
|unless you charge right at battery voltage. If your alternator is just
|barely big enough to handle the job and it works fine with say one battery
|and you go in there and add 6 more batteries you will see less watts, now
|all of this is assuming the system is "truly" wired with enough conductor
|on both positive and negative sides of the system from the alternator to
|the amp.
|
|Now this my "simple example" and it has a very "simple concept" its called
|time tested truth, and not to be a knowitall but I will stand behind this
|one until the end.

the d104m6b mods that he is talking about is to make the audio less
"tinny"...it has nothing to do with the power of the microphone,any more power
out of that mic is nothing but trouble,but especially on SSB the audio sounds
to "tinny" and flat....that is what the mods are for.73's

Do you know what would be involved in order to "high level" modulate a
100 watt rig, like the Kenwood?

Assuming that you didn't mind all the external wires and connections (as
there is probably no extra room inside the radio), you would have to
fabricate a modulator capable of at least 50 watts of audio power, you
would have to add a modulation transformer to the final B+ line, and
attach the mike level, high level output, and power leads.

I'd leave it stock.....

For a ground to be effective at RF frequencies, it has to be a short as possible with as much surface area as possible. A flat "strap" is better than a round wire. If you can bolt the cases of the radio and amp directly to the body of the car (Which is tough in today's vehicles), so much the better.

The reason that I mentioned the long wire as how NOT to ground, is that a sufficient length of wire starts to look like an antenna to RF, and will make the problem worse. Think "short and flat" as opposed to "long and round".

Believe it or not, I've run a Texas star 5 pill through a mag mount antenna before and never did anything to the paint. I did eventually fry the antenna though (a K40). I was very lucky that I didn't have squeal problems. I did have problems with the RF getting into the vehicle electronics and causing problems. When I went to the body mount whip, this all went away.

Most times, the white under a magnet mount antenna, is due to
trapped moisture.

Sometimes you just have to be smarter, not faster.

A farmer goes out and buys a brand new stud rooster for
his chicken coop. So the new rooster struts over to the old
rooster and says, "OK, old fart, time to retire."
The old rooster replies, "Come on, you can't handle ALL
these chickens, look what it's done to me. Can't you just
let me have the two old hens over in the corner?"
The young rooster says, "Scram! Beat it! You're washed up
and I'm taking over."
The old rooster says, "I'll tell you what, young stud, I'll
race you around the farmhouse. Whoever wins gets exclusive
domain over the entire chicken coop."
The young rooster laughs, "You know you don't stand a chance
old man, so just to be fair, I'll give you a head start."
So, they get a chicken to cluck "Go!", and the old rooster
takes off running. About fifteen seconds later, the young rooster
takes off after him. They round the front of the farmhouse and
the young rooster has closed the gap. He's already about five
inches behind the old rooster and gaining fast.
The farmer, meanwhile, is sitting on the front porch when
he sees the roosters running by. He grabs up his shotgun and
BOOM!, he blows the young rooster to bits.
The farmer sadly shakes his head, "Damn it, ...third gay
rooster I bought this month."

i was just wondering what the group feels is the best method(s) to obtaining the best audio quality,now i dont mean loudness and echo...i mean downright quality audio...do you guys prefer modified radio's with stock mic?power mics?mic pre-amps??or what,what do you guys run,and what reports do you get?basically what im trying to say is,what do you feel is the most important approach to quality audio...whether it be am,ssb, or even fm?????

ps-once again..any idiot can make there audio LOUD....im talking about all around performance and quality,,,73's

2495. Re: Amps Per Watt?

Newsgroup: rec.radio.cb

Scott, power divided by voltage is only part of the equation. You also have to factor in the efficiency of the amplifier. No amp is 100% efficient. Also will 50 watts be the peak output? Or the average? Most power supplies list their peak output not continuous output. I would recommend a power supply in the 8 to 10 amp range.

2505. Microphone, Microphone.

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: Bob <Bob@bob.com>
Message-ID: <385E9253.BE1BA0A4@bob.com>
Source record: 15954

It all starts at the Microphone. I prefer high quality studio microphones (electret-condenser types, NOT dynamic types). I don't think there is any need for any more pre-amp between the mic and the radio. Usually, these types of mics put out enough to drive the radio. Besides, another level of pre-amp introduces more distortion in audio.

Next step, the radio should be a good quality radio...(read HAM radio). Not these cheap, Taiwan garbage radios (Rangers). Kenwood, Yaesu or Icom (or Collins or Drake for some good sounding AM). Next, make sure the audio-passband is nice and wide. Usaually, this just requires changing some capacitor(s) in the mic-audio preamp stage in the radio.

Next, add a little RF (not AF) compression to the mix, if your radio can do so. Finally, if you are going to use an amp (I am talking 1KW or over) - please, use a good old tube amp.

Run everthing nice and normal, don't overdrive things (mic, amps) - it causes distortion, and your audio will be great.

If you insist on using that D-104 mic with the Crystal element, please, build a simple circuit to step down that high impedance mic to match the 600 ohm impedance of your modern radio. You will no longer need that preamp and your audio will be so much more fuller.

Later,

The Ghost of Bob.

Tim,

We carry two types of glass related antennas. The first one is the glass mount antenna that you mount by sticking the antenna to the window. The coax is then stuck to the other side of the glass and that is then routed to your radio. This one is made by Antenna Specialist. It is model M-906. It is a cellular look alike and we retail it for $29.99.

The second is made of three parts. a)the Cherokee SA-4 antenna. It is 30.5" long has a male BNC connector and is $14.99. b) the Workman WMWC-1 antenna mount that is set on the top of your roll up window glass, it is locked in place when the window is rolled all the way up. This mount has a outside female BNC connector and on the inside a 8' RG-174U coaxial cable with a male BNC connector. We retail this mount for $9.99. c) the Workman 40-2620 female BNC to male UHF. We retail this connector for $2.19. Antenna to mount to connector to radio total cost $27.17.

We wholesale and retail the above items.

2515. Re: Amps Per Watt?

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: tnom@mucks.net
Message-ID: <jZteOLi79x3uliR9eMhdFwYS+5mw@4ax.com>
Source record: 15964

Snip
> Okay, so I can run a 50 watt amp off of
> 6 amps or not? I can't seem to get a
> straight answer on this. Does anyone
> know? You're saying that I can run
> a 70 watt linear off of a 5 amp
> linear? 50Watt / 12Vlt = 4 (approximately)
> It still doesn't sound right.
Snip

It doesn't sound right because it isn't.
Most radios run around 50% efficient.
Some linears run at as much as 70%
efficiency. I take it you are talking
about a 50 average watt linear, not
a 50 watt average radio.

If that's the case then: 50/12 = 4, but
then you must factor in the inefficiency.
So:

4 x the inverse of 70%, or 4 x 1.42857
= 5.7 amps.

This 5.7 amp figure is with a highly
efficient amp. If your amp is only 50%
efficient then you will need an 8 amp
supply. Furthermore a six amp supply can
run a 66% efficient 50 watt amp at 12
volts.

p.s. most cb linears run around 66%

2516. Re: RF TRANSISTORS

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: Skipp <skipp@pilot.ucdavis.edu>
Message-ID: <83m79g$10f$2@mark.ucdavis.edu>
Source record: 15965

: Who feels that "matching" of RF Transistors (as performed by say, RF Parts)
: is unnecessary? Who feels it is necessary? Why do you say it is either
: unnecessary or necessary?

Because bi-polar transistors near their limits will heat up and draw more current. If you have proper bias current tracking in your amplfier, the circuit will properly control the transistors evenly. Unmatched transistors will not share current and your in for big trouble. The replacement costs are much more than the extra matched pair fees.

cheers
skipp

Hank if you are going to DC ground the base through the xfmr and drive the piss out of them, I do not think it matters at all. In some cases running positive voltage on the base of the transistor would require matching but very seldom have I seen a need for this unless you are replacing just one of the transistors.

>
> Who is correct and why?

Cutting the modulation limiter on a radio disables the AMC/ALC. This allows more audio as the modulation is not "limited" to the stock figure of around 80% (depending on the radio.. Some are only 50% others up to 90%.) Cutting the limiter is an easy way to boost the modulation and peak power on most CB radios. Take the Cherokee CBS 1000 base for example.. Even when the AMC/ALC is cranked the limiter pulls back hard and clamps the audio. You can really hear this on the air if you know what to listen for. On that radio you really need to either cut the limiter or add a resistor to one leg to raise the point of which the limiter clamps. Of course you could also swap in a different transistor but you will get the same effect if you just add a resistor. That is one of the few radios that I usually end up removing the limiter all together. Allot of older radios perform worse if the limiter is just removed. Some will severally over modulate even with the stock mic after the limiter is cut. So... On certain radios for certain people I cut the limiter out. Most of the time I tune them correctly so the circuit is still working but just on the edge. This keeps the radio clean but it will still have good audio output. I never remove the limiter unless I absolutely have to or it is requested. Even then I will try to pad the transistors effectiveness first. As far as Techs saying to run as fast as you can if you catch a tech snipping a limiter goes its not really that simple. If a guy requests it I will do it. What they are implying is that anybody who just opens any radio and cuts the limiter must not know what they are doing. This is a bunch of crap. I don't know everything by any means but I can look at a scope and watch modulation.. If the radio performs better and still remains somewhat clean with the limiter out I say cut it....

It was an example, on a peak meter it is not swinging down. It could be me but I think the big carrier works better in that heavy duty DX, if I did not tell you I was keying high, your ears would not tell you. the audio is crystal clear when doing this.

This is a tricky one. What I like you might hate. But for me it is an older Tube radio with a D104 mic. Each radio has a distinct sound. Time and time again people tell me that my Johnson 223 or my black face johnson with a D104 is the best clearest station they have ever heard. I don't over drive it. Just enough to make it talk but clean.. Its real hard to beat a Johnson on the audio clarity. Match that up to a modulator as a driver and you have one clean sounding but still loud station. One guys setup came to mind as I was typing this out. A FT 101EE with a D104 that a local has is an incredible combo. I am talking about the older D104's. The old lollipop or Chicken Choker that was hand wired. I liked it so much I picked up a 101ee and used the same mic. 101's really sound nice on AM if they are run right. I cant stand the sound of some of the newer radios when people use power mics to overdrive them. The point of CB is to communicate and if you cant hear someone clearly what's the point? Don't get me wrong. I like to get out there at times and run some serious audio. But most of the time I run it down and would hope it sounds good (I have never heard my station. Hey Toll, That's what we forgot to do.).

I am a sucker for Plate modulation and a old D104....

The only thing all this swing accomplishes is it makes the transmit
output meter and receiver s meters swing wildly with modulation which
makes everyone think they must be putting out a really big signal
because the meters are swinging. Other than that, it accomplishes
nothing.

No John it doesnt sound like a beacon It sounds like a pulse to me could be
a plasma machine at work many of them work around 27 mhz and put out some
good watts

No.. I would run a 10 amp supply.

You can also count the number of transistors in the thing....

If it has 2290s or 2879s, then you need about 20 amps per transistor at 15 volts.

If it has 455s or others, then 10 to 15 would be plenty.

Toll Free

2542. Re: NO IM STILL NOT FINISHED!!

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <CUy74.1560$y3.63786@insync>
Source record: 15991

O.K., if you really want to know..

To figure out the collector to ground impedance of a base driven, common emmiter transistor, you take the following formula...

(Vcc*Vcc)/2Pout.

This is per transistor.. Therefore, if you are seeing (on average) 100 watts per transistor (IE, a 4 pill doing 400 watts) at 13.8 volts, you would have....

13.8*13.8=190.44

100 * 2=200

Therefore, the true collector load for each transistor is 190.4/200, or .9522 ohms.

Now, plug this number into the standard Ohms law equations, and what do you get?

Watts / R = Isquared

100 / .9522=105

Now, take the square root of 105, and you get 10.25 (or right about their.).

Multiply that by 1.3 (which would give you the appropriate formula for getting to the correct 70 percent efficiency (this is a supposed designed for number) to get the correct efficiency and you get...

13.325 amps.

Multiply that number (the current) by supply voltage and you get what...

183 watts of input... Which would be right along with what you need for 100 watts of input.

Their... Guess your education was wasted, eh????

And here is your last comment, just to be on the safe side...

Toll Free

THE REASON YOU GUYS CANT FIND THE CURRENT IS BECAUSE YOU ARE USING THE WRONG LOAD RESISTANCE!! You are using 50 Ohm that is your load at the antenna do you care how much current is at the antenna?? I don't care. My point is you can only find Current in side the circuitry on single resistances not A general overall resistance!!!

Unless you can tell me the resistance of the amplifier. Put a multi meter
across the Power cables of an amp and tell me what you get!!!!

If your meter reads 50 Ohms call me an asshole.
If it doesn't now you know why I paid for my education!!

That is, collector voltage squared divided by twice the power out.

> 1.) Choice "A" would have to swing to 1000 watts for 100%

I am assuming you are using a bird 43 for this test..

Choice A is a 200 watt carrier and a 500 RMS on audio.. 500 watts RMS is 1414 peak watts. 1400 peak watts with a 200 watt carrier is over modulation..

>
> 2.) Choice "B" has 0%.

Actually Choice "B" has more than 0%. That would mean a 500 watt carrier with 1400 peak watts. That's around 1/3 of the peak.

>
> 3.) choice "C" is keying up with 800 watts and dropping down to 500 Not
> good!!
>

That's really 800 watts with a peak of 1400. I would still run choice "A" or choice "B". I bet choice "A" would win in a contest as he would be the loudest..

Just in case you did not know how to figure peak power from an RMS figure on a bird here is how:

Of course this does not apply to an AM carrier... Only a modulated signal.

Take the modulated RMS figure and times it by 2.828 times to get peak.. That 500 watt RMS figure from choice "B" was really over 1400 peak watts. As you can see it is not tight.. To prove this I did a test at home with my new Bird43 peak meter and a SB 220. On modulation my SB 220 was showing 700 RMS bird. I flipped the peak switch on and the meter read right between 1900-2000 watts holding (2.5kw slug). Do the math: 700 X 2.828 times is =1979 peak watts. It was exactly on.

MC Turner.. (I guess I will start using my full name "MC Turner" again as I see there is another MC on the group now. I would not want to get confused with him and I am sure he would not want to get confused with me :) Things have changed in the last 4 years on this group..

2550. Re: watts vs swing

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: prozac 625 <xeroeightytwo@aol.com>
Message-ID: <E3z74.6836$mv4.195636@news.rdc1.nj.home.com>
Source record: 15999

Peak is RMS * .707 or about 70% more then the RMS.
RMS is peak / .707 or about 70% of the Peak
What do you need a meter for?

| Just in case you did not know how to figure peak power from an RMS figure
on a
| bird here is how:
|
| Of course this does not apply to an AM carrier... Only a modulated signal.
|
| Take the modulated RMS figure and times it by 2.828 times to get peak..
That
| 500 watt RMS figure from choice "B" was really over 1400 peak watts. As
you can
| see it is not tight.. To prove this I did a test at home with my new
Bird43
| peak meter and a SB 220. On modulation my SB 220 was showing 700 RMS
bird. I
| flipped the peak switch on and the meter read right between 1900-2000
watts
| holding (2.5kw slug). Do the math: 700 X 2.828 times is =1979 peak watts.
It
| was exactly on.
|
| MC Turner.. (I guess I will start using my full name "MC Turner" again as
I see
| there is another MC on the group now. I would not want to get confused
with him
| and I am sure he would not want to get confused with me :) Things have
changed
| in the last 4 years on this group..
|
|
|
|
| >
| > |

EXPORTS-R-US SUCK!!!

I bought a radio from them and pre-paid, but never recieved it. When I called them back, they said"OH, it's on order and we're out of stock"

Funny how you didn't say that when I was giving you my credit card # !!! What a bunch of morons.

Called Express Electronics (Exportradios.com) and got it withing 4 days tweeked n' peaked!!!

Now my credit card company is going to get involved with them since they won't give my money back.

What a bunch of assholes.

Max

2554. Newsline 1166 - 12/17/99

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: "William M. Pasternak" <Newsline@ix.netcom.com>
Message-ID: <83lo5k$kk6$1@nntp2.atl.mindspring.net>
Source record: 16003

Newsline 1166

Newsline report number 1166 with a release date of Friday, December 17th 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T. Six meters opens with the best winter D-X conditions in forty years, the A-R-R-L says it
will appeal further to expand P-R-B one and will cellular phones soon replace ham radio as the best way to get
help? All this and more on Newsline report number 1166 coming your way right now!

(Billboard Cart Here)

**

It was 1959 all over again in 1999 as six meters gave hams world-wide a pre-Christmas opening reminiscent of one
that occurred forty years ago. For hams in the United States, Saturday, December 11th brought a coast to coast
opening that was armchair copy. Take a listen:

Daves DX audio Here

That was Newslines neighbor Dave Booth, KC6WFS making a contact with K3UM in Williamsport Pennsylvania while
running only about one watt out of an M-F-J six meter SSB transceiver. In simpler terms, that QSO amounts to
about 2450 miles per watt! And that was not the only DX that Dave Booth heard or worked. Take a listen:

Daves DX Audio Here

But KC6WFS was not the only stateside ham to report amazing 6 meter DX conditions. Dave Bernhardt, N7DB, in
Boring Oregon tells over the VHF Reflector of his unexpected mid-winter DX. Dave says that he began working
stations at about 17:40 UTC. The first station that Dave contacted was Bruce Sternstein., K2RTH in Miami
followed by Austin Regal N4WW in Apopka Florida. He then began hearing stations further North and worked Dennis
Lansa AA3ID in Frisco North Carolina, Mario Rotundo K2MUB in Swan Lake New York and Elbert Gross, K2SPO in

Rochester.

For stations in the Mountain states to the East Coast an opening on Sunday December 12th provided an almost
repeater quality path up to Alaska. Brian Allen, N0VSB in Elizabeth Colorado was one of the first to hear about a
half a dozen Alaskan stations including KL7NO. He says KL7NO was 59 plus 20 DB for almost an hour.

Moving East, Dave Calvert,KB0PE, in Saint Louis Missouri reports working Alaskan stations KL7NO, KL7FZ and NL7Z
before -- as he puts it -- somebody stole the whole 6 meter band. Dave's contacts took place between 21:40
and 21:57 U-T-C just before 6 meters went to sleep.

But KB0PE was not alone. Even further to the east in Pasadena Maryland, Fred Heath, N3XBG says that he was
able to work NL7Z on 50.135 on only his second try. Fred also reports hearing KL7FZ but says that he was
generating a huge pile-up on 50.125 MHz.

The openings continued into Monday December 13th with reports that Ron Jay, WH6O at Ewa Beach Hawaii was
heard working stations in California, Mexico, New Mexico and Alabama. Reports from overseas like that of New
Zealand's Mike Foubister, ZL3TIC who worked numerous Western United States and Mexico satations also says a
lot. It says that this is one of the best surprise six meter winter DX seasons ever recorded. (Newsline)

ARRL SEEKS PARTIAL RECONSIDERATION OF PRB-1 PETITION DENIAL

The A-Double-R-L will continue its battle to minimize or eliminate restrictive laws that keep hams from putting up
antennas. This as it decides to file for reconsideration on a recently denied request to have the FCC expand the
scope of PRB1, Rick Lindquist, N1RL, of the ARRL Audio News has more:

The ARRL will ask the FCC to partially reconsider its dismissal of RM-8763,
the League's 1996 petition that sought to strengthen and clarify the limited
federal preemption policy governing Amateur Radio antennas known as PRB-1.
The League also agreed to fund a Florida antenna case with PRB-1implications.

In its petition, the ARRL wanted the FCC to prevent states and localities from enacting provisions that frustrate
the intent of PRB-1 or make it costly to apply for permission to erect an amateur antenna. The FCCdismissed the
petition in its entirety November 19 and indicated it was unwilling to go beyond what is already spelled out in PRB

1. "We continue to believe that the standards the Commission set, that is 'reasonable accommodation' and
'minimum practicable regulation', have worked relatively well," the FCC said.

The League will ask the FCC to reconsider two important aspects of the original petition. Meeting December 4 in
Texas, the ARRL Executive Committee voted to instruct the League's General Counsel to seek reconsideration of
the FCC Order regarding the application of PRB-1 to restrictive covenants and to excessive costs that localities
might levy or require in order to
install an antenna structure.

In its dismissal, the FCC pointed out that PRB-1 excludes restrictive covenants in private contracts as "outside the
reach of our limited preemption." The Commission added, however, that it "strongly encourages associations of
homeowners and private contracting parties to follow the principle of reasonable accommodation" with respect to
Amateur Radio.

In addressing zoning laws and application costs, the FCC dismissal Order asserted that the PRB-1 principles of
"reasonable accommodation" and "minimum practicable regulation" already provide sufficient guidance to
communities. Local zoning ordinances should be written so as to "not impinge on the needs of amateur operators to
engage in amateur communications," the
FCC said.

In a related action, the Executive Committee agreed to have the League fund an appeal in a Florida Amateur Radio
tower case. Lenard Persin, WB4HZQ, had applied to Seminole County for a special exception to a 35-foot tower
height limit to build an 80-foot tower on his nearly one-acre lot. Initially granted, his application was later denied
after a neighbor appealed. Persin
appealed in federal court, and the ARRL filed a "friend of the court" brief in the case. On November 2, a US District
Court in Florida ruled for the County, saying it had "properly balanced Mr. Persin's interests with the needs of the
community."

In its November later dismissing RM-8763, however, the FCC declared that, given the express language of PRB-1,
"it is clear that a 'balancing of interests' approach is not appropriate."

In addition to filing the reconsideration request, the ARRL 's President Rod Stafford, W6ROD, has appointed a
committee to study how the League provides support for antenna cases. (ARRL)

**

FCC INVESTIGATING SOUTH CAROLINA EXAM SESSION

Acting on information aparently supplied by the ham radio community, the FCC has begun an audit of a South
Carolina ham radio test session. Speaking on Hap Holly's RAIN Report Enforcement Log, the FCC's Riley
Hollingsworth K4ZDH, that there have been claims of some major problems with this particular exam gathering:

Hollingsworth Here

So far the FCC has sent letters to the VEC's that conducted the session asking them to verify the authenticity and
accuracy of the paperwork. They have also directed for hams who attended a W5YI session to retake their tests
at an ARRL sponsored VE test. (FCC, RAIN)

**

FCC COMMERCIAL RADIO FORFEITURE WATCH

Hams are not the only ones feeling the FCC's sting. A $4,000 fine has been levied against WPBZ FM of
Indiantown, Florida. The FCC alleges that WPBZ broadcast a telephone conversation without first informing the
party to the conversation of its intention to do so.

Meantime, Entergy Security Corporation has had its FCC invoked fine reduced from $12,000 to $9,000. Entergy
had been charged with acquiring control of two microwave stations without prior Commission approval. (CGC
Communicator)

serving Lincoln and Omaha Nebraska.

**

NEWSLINE TEMPORARY SCHEDULE CHANGE

I'm Bill Pasternak, WA6ITF, with word of a temporary schedule change for the release of Newsline. Beginning with
next weeks report number 1167 and continuing until at least after the FCC releases its Report and Order on
restructuring the United States Amateur Radio Service, Newsline will release its latest newscast at the close of
government business each Friday. That is 3 P.M. Eastern and noon Pacific. Doing this will

give us the ability to
bring you any news regarding restructuring should it occur at the end of the government business week.

Once again, effective with Newscast 1167, the release of Newsline will be moved back to Friday at 3 P.M. Eastern.
Please adjust your recording and playback schedules accordingly. This revised release schedule will remain in
effect until the Report and Order on restructuring is announced. Now back to Mert Garlick, N6AWE.

**

ARRL TO OREGON SCIENTIFIC: 433 MHZ IS A HAM BAND

The ARRL's Lab Supervisor Ed Hare, W1RFI, has written to the Oregon Scientific supply company over concerns
about a product that the company advertises as operating in the 433 Mhz ham band. In his letter to Oregon
Scientific's Josh Cress, Hare informs the company about the anxiety on the part of the ham community over a
remote-reading thermometer, that uses 433 Mhz to transfer data to the base unit.

Hare explains to Cress that devices such as this thermometer are regulated as unlicensed transmitters by Part 15
of the FCC's rules. Hare says that Part 15 does permit some higher-powered unlicensed operation on nearly any
frequency above 70 Mhz. But he adds that this high-power operation is limited to very brief transmissions, for
remote-control purposes, with requirements that the device turn itself off after 5 seconds and that it not transmit
at regular intervals.

Hare says that Part 15 does permit much lower power on virtually any frequency, but at 433 MHz, such low power
would be useful for only a few feet at best. He also reminds Oregon Scientific that Part 15 requires that most
intentional radiator devices be "Certificated" by the FCC prior to their being offered for sale. He tells them that
certification is issued by the FCC based on the test data supplied by the manufacturer as part of the application.
Hare says that this test data will very much help to determine on what basis this device operates on a frequency
allocated to the Amateur Radio Service.

Hare has requested that Oregon Scientific provide the League with the thermometers FCC ID number and any other
technical data . Hare isays that he hopes to help resolve the matter without FCC assistance if Oregon Scientific
can answer the questions about the device and its operation. (VHF Reflector)

**

FCC TO WOKIE: NO BROADCASTING IN THE HAM BANDS

An Oklahoma ham who had sought a rules change to permit broadcasting in the UHF ham bands has had his
request deniewd by the FCC. Mile Reynolds, W0KIE, had asked the FCC to permit hams to make one way
transmissions to the general public in the 70 centimeter bands and those above it. The FCC dismissed his petition
without ever assigning it a rule making number.

Reynolds who operates the W0KIE Satellite Network has until recently been the provider of satellite distribution of
the Houston AMSAT Net, This Week in Amateur Radio and several other ham radio special interest programs. At
airtime it is unknown if W0KIE plans to file an appeal. (Listener reports)

**

UNYREPCO TO COORDINATE DUTCHESS COUNTY NEW YORK REPEATERS

Is repeater coordination about to reappear near the New York City area? Possibly, as members of the Mount
Beacon Amateur Radio Club vote toadopt the Upper New York Repeater Coordination Councilas the repeater
coordinating agency to serve Dutchess County, New York.

Dutchess County lies to the North of New York City proper. According to Lloyd Frink, KC2AGL, writing in the
Hudson Loop electronic newsletter, the Mt. Beacon club took this action at their December 2nd meeting. This,
following a discussion on the present status of amateur repeater coordination activities, or lack thereof, in the
Dutchess County area.

As reported, almost four years ago the Tri-State Amateur Repeater Council that previously had served the area
slipped into inactivity and disappeared. All attempts to revive it or to form a new coordination council have met
with strong opposition from New York City and Northern New Jesey repeater system operators. Connecticut finally
broke ranks last year and formed its own statewide coordination group. Now, the Uppper New York Repeater
Coordination Council has expressed a willingness to serve some of the area previous served by Tri-State and the
Mount Beacon club has accepted the offer for the area that their repeaters serve.

The Upper New York Repeater Coordination Council is one of the nations oldest and most successfull volunteer
coordination bodies. It has has been active in amateur repeater coordination since 1973 and already has
agreements in place for cross-coordination reviews with neighboring repeater councils.

KC2AGL says that the Mt. Beacon club hopes that in choosing the Upper New York Repeater Coordination Council
as the representative of its repeaters that the group is setting a positive example. One for other neighboring

counties in need of repeater coordination to follow. (Hudson Loop)

**

NEW LAW MAKES EVERY CELLPHONE ABLE TO CALL 911

Will cellular telephones now be challanging ham radio in the area of public service communications? Thats the
question on the minds of hams involved in public service and emergency communications have been asking since
President Clinton signed legislation making 911 the official emergency telephone number nationwide. This, for both
wired and cellular phones. The measure also calls for development of technology that can track mobile callers.
The White House says that this will allow average citizens with wireless phones to speed responses to highway
accidents, crime scenes and natural disasters.

What all this means to ham radio is hard to predict. It wll probably reduce the need for radio amateurs to report
traffic accidents. This as cellular and P-C-S monthly charges continue to plumet making mobile phones available to
more and more members of the general public. (Adapted from published news reports)

****

HANDI-HAMS NEEDS VOLUNTEERS

The Handi Hams say that they need more volunteer readers to record rig manuals onto cassette tape for the blind.
The service group is also looking for hams who have the equipment and time to scan manuals and books into text
file format. If you can help, please contact Nancy Meydell for a Handi Ham volunteer application at 612-520-0512
or by e-mail to nmeydell@courage.org. (Handi Hams)

FCC COMMISSIONER WILL NOT RUN FOR CONGRESS

Federal Communications Commissioner Gloria Tristani says she plans to stay in her current job and not seek
election to congress.

According to Tristani, she had given some serious thought to a congressional bid from her home district in
Albuquerque, New Mexico. But the Clinton administration has urged her to stay at the FCC and she has decided to
do so.

Tristani is one of three Democrats on the five-member commission. (Published news reports)

AUSTRAILIAN ATV CHANGE OF HEART

In ATV news, the Australian Broadcasting Authority has had a change of heart concerning the future of an
Amateur Television repeater operating in the Brisbane area. The ABA had originally told the repeaters sponsor that
the machine would have to leave the air to make way for testing of a new commercial digital television system.
Brisbane area hams mounted an offensive of their own They said that there was no reason to take the ATV
repeater off the air, arguing that the two should be able to co-exist. Peter Jones, VK4YAC, was one of those who
helped the Australian Broadcasting Authority change its mind:

Jones Here

In-Q: The ABA has had...
Out-Q: ...late next year.

The idea to keep the Brisbane ATV repeater on the air as digital television broadcasting tests begin is a good one.
It will provide some interesting data on the compatibility or non-compatibility of digital and analog services
attempting to share the same or closely adjacent spectrum. (Q-News)

**

SOUTH AFRICA

The Board of Trustees of the independent South African Amateur Radio Development Trust have bestowed the
Zed-S Radio Amateur of the Year Award on Chris Turner ZS6GM. It has also named Henro Ritchie ZR6RIT as its
Young Radio Amateur of the Year. (SARL)

AMSAT UK COLOQUOUM 2000

AMSAT U-K has put out its first call for papers to be presented at next summers ham radio space colloquium.
Jeramy Boot, G4NJH has the details:

The 15th AMSAT-UK Colloquium, "Amsat Space 2000", will be held at Surrey
University, Guildford, Surrey, U.K., from Thursday 27 July to Sunday 30
July 2000.

Amsat-UK invite authors to submit papers, about amateur radio space and associated activities, for this event and for the "Proceedings" document which will be published at the same time. We normally prefer authors to present the papers themselves rather than having someone else read them in the authors' absence, but we also welcome "unpresented" papers for the document.

Offers of Papers should be submitted as soon as possible; the final date for full documents to be received is mid-June 2000 in order that the "Proceedings" document be available to participants.

Submissions should be sent to G3RWL by e-mail to g3rwl@amsat.org

Jerany Boot, G4NJH

Again, those dates are next July 27th to the 30th at the University of Surrey in the U-K. (G4NJH, AMSAT-UK)

**

AMSAT-OSCAR-16 SILENT

AMSAT OSCAR 16 appears to be temporarily QRT. LW1DMO reports that the satellite went silent while in range of
his ground station in Buenos Aires at 02:35 UTC on December 12th. The satellite was also monitored on 00:45 UTC
on December 13th at KD2BD in NewJersey, and was found to be silent. AO-16 had been operating for over 1800
days without a software reload or an interruption in service before this problem occurred. (AMSAT BBS,
Spacenews)

**

DX AND CONTESTS

In D-X, members of the Carolina DX and Roswell DX Associations will be on the air during the month of January
exchanging the call WY2OOO with other operators around the World. This operation will begin at 0000 UTC,
January 1st, 2000 on all bands from 160 through 2 Meters. QSL the WY2OOO operation with an S-A-S-E to
K4MQG. (K4MQG)

The 5-9-9 DX-Report says that that Lawrence De Milner, W8NRB, has been active as from Nepal as 9-N-7-R-B
since mid-September. Listen for Lawrence mainly on 20, 15 and 10 meters S-S-B. He willbe there for some time.
Q-S-L via W8NRB at the W-8 Bureau. (59(9) DX Report)

NOTE TO WEB TV USERS

And finally, this note for those of you who listen to Newsline in Real Audio over the Internet. Tucson Amateur
Packet Radio has upgraded its audio server to the latest Real Media G 2 software which supplies far better audio
quality than ever before.

But there is a problem for users of Web T-V users. Simply said, Web T-V is not a real computer system and it
does not currently support Real Media G 2 technology. According to Tony Gardner, N4DFM, who is one of our
regular listeners, Web-TV users petitioned Web-TV for Real Audio G2 a while back. About a month ago, Web-TV
users received an upgrade, but it did not include Real Audio G 2. Also, a Real Audio G2 arrangement that was
posted on the Web-TV web site is gone.

While we cannot help with most Web T-V problems, for Newsline listeners there is a solution. Mark Bohnhoff,
WB9U0M, in Chicago maintains a Web TV compatible Real Audio site for several services including Hap Holly's Radio
Amateur Information Network and Newsline. To get to Mark's site go to www.arnewsline.org and scroll down until
you see the link to Bohnhoff Mediacasting. Click on it and then click on the box marked Real Audio 2 at 14.4.

Our thanks to Tony Gardner, N4DFM, for bringing the matter to our attention and to Mark Bohnhoff, WB9UOM, for
providing Web T-V listeners with a solution. (Newsline)

kjfdskdj@jejr.com wrote:

> Is it a great radio?

Yes.... Every feature I want and some I don't.

> Whats it put out?

Stock about 2-8 watt AM carrier and about 25 pep. 30 Peak pep on SSB.
Fm is the same as the AM carrier..

My Modulator and tune job = 1 to 8 watt carrier. 40 pep from any dead
key on AM.
SSB 40-45 watts. All this without ripping the Limiter.....

>
> Is it really effective at disguising voice?

Not really. It is a novelty. If you use enough to where people can
understand you then it is easy to pick out the voice and voice pattern.
If you use to much then people can not understand you at all. I do not
use mine at all.

>
> Where can I get one over an internet store?

Many places..

Exports R US (steve is a friend)
http://hometown.aol.com/CBs313/Index.html.
Bills2way.com
Tomasdistrubuting.com
Copper.com (I got a bad one from coppers once)

And many others.....

All in all the king of the Exports. There are better quality radios
available. For instance the president line of radios. But the Galaxy
High level audio gets the job done. If you are mainly an SSb talker
then get president radio. If its loud AM you want get the 99v. Oh and
my Modulator is on www.pantherco.com under mods then MC Turner....

Good luck..

MC

NO.. Allot of the transistor base amps run higher voltage than I would use to run a radio. some of the better units idle at 20 volts internally. Of course they sag under load so the pills see 17-18 volts. I would never run a radio of that much. The Palomar is designed to run external devices at 13.8 volts..

I have heard of people using 220 volt AC motors to turn several alts to run a 8 pill or 16 pill with good luck. It can be done. Back when I used to compete in IASCA car stereo competitions I knew a guy that had a Hydraulic pump mounted up on the engine with hoses that ran back to a alt rack in the back of his blazer. He could spin 8 200 amp alts no problem with less load on his engine. I cant believe that nobody is doing this. You can vary the line pressure to get different RPM's on the alts. Key down and then start opening the valves until the desired RPM and volts are obtained. Split the alts into groups. Hit one valve and then get say 3 spinning. Then at the half mark hit another and get all 6 spinning with high volts... I am sure one day I will see this...

> you want to deadkey next to nothing and swing so much?

Ok for a true AM signal you would need to have the carrier at 1/4 of the peak power to be at 100% modulation.. So a 4 watt carrier would need a 16 watts peak. This is the preferred method. Reducing the carrier will exaggerate the modulation. Some of us call this : Suppressed carrier AM modulation. You gain audio by reducing the carrier in most cases. Running a high carrier like say 8 watts with the same setup will not allow "room" for the AM signal to reach 100% output modulation. In other words it would sound tight or pinched. You can get away with running a high carrier is some situations. Most of these setups are Class C battle box setups with radios that are severely over modulated. In this case even though the carrier is high it still sounds "loud" Even though the loudness people hear is really distortion.. I am from the group of people that like to run a station that has more than enough room for the output signal to produce 100% mod. I believe that whoever is producing the most audio and the highest peak power will win over a guy that keys up and back swings... All the while it is easier on the equipment to key less and swing high....

MC

2564. I still didnt finish!

Newsgroup: rec.radio.cb

The only way to calculate true power is across each load or resistance.

(1.) The true formula is Current (I) squared Times Resistance (R)

(2.) Now that you have the power you can divided by the voltage and get the current. But keep in mind that the current you just found is only true across that load!!!!!!!!!!!!!!!!!

Basically this gets you no where since you need current in the fist place to do what I just said. THAT WAS MY POINT YOU GUYS ARE GOING ABOUT IT ALL WRONG.

look AT STEP (1.)

(a.) Now you know this is the only true way to find Power!
(b.) You already know the power cause you have a Bird meter or what ever.
(c.) you know your load (I hope).

Your new formula is CURRENT= THE SQUARE ROOT OF (POWER /RESISTANCE).

>

True..

>
> Swing Kits will increase modulation.....which in turn make you seem
> louder.....

True.. I will add that I only run a modulator style setup if the radio is going to be used to drive an amp that likes a low keyup but will make use of some good peak power. In other words I setup modulators in radios if that is needed to get an amp output of 1/4 the peak with good audio and good peak power.

> and despite this argument of due to lower
> carrier....etc....etc.... I have a question for all of you I suppose....
> who the hell hears someone's carrier when talking skip?!?! Just a
> question....
>

That is true. The guy with the most audio and peak power will be heard... But it still is impressive to hear a huge carrier come out and wipe the CH clean even if the audio is lower.. :)

THE REASON YOU GUYS CANT FIND THE CURRENT IS BECAUSE YOU ARE USING THE WRONG LOAD RESISTANCE!! You are using 50 Ohm that is your load at the antenna do you care how much current is at the antenna?? I don't care. My point is you can only find Current in side the circuitry on single resistances not A general overall resistance!!!

Unless you can tell me the resistance of the amplifier. Put a multi meter across the Power cables of an amp and tell me what you get!!!!

If your meter reads 50 Ohms call me an asshole.
If it doesn't now you know why I paid for my education!!

I guess if everyone had there own river in there back yard we wouldn't need the water company at all would we? Come I'm talking day to day logic here. Your talking longshots.
How often do you see batteries explode?
How many Leece Neviles have you seen go bad because of over drive from a CB amp? YES I KNOW IT CAN HAPPEN BUT TELL ME HOW OFTEN IT DOES AND HOW MANY TIMES YOU SAW IT FIRST HAND!
Buy the way if your worried about a few pennies in gas your in the wrong hobby sine it is one expensive hobby.

"Sean" <bigfoot1@megsinet.net> wrote in message news:Jek74.138$ct.12895@news.corecomm.net...
| Boo is right. The alternator system needs to be able to supply ALL of the
| current with no sag at any time. The batteries are simply buffers that CAN
| bog down the system IF the alternators can't keep up with the demand. After
| all, even after you turn off the faucet, the river still has to fill the
| storage tank that you just depleted.
|
| More alternator with less battery equals lower maintenance, less chance for
| boiling over or explosions, damage to one's self or the vehicle from fumes,
| less weight and wear and tear on the motor / trans, better gas mileage,
| etc... The alternators only produce as much power as needed on demand.
| Sean
| >
|
| -=PEAKABOO=- wrote in message <83k29s$q91$1@nntp8.atl.mindspring.net>...
| Do some testing and see if more batteries are better, break out your dc
| current transformer and take a current reading on the wires feeding the
| batteries from the alternators, then take a reading between the amp and
| the batteries you will see a little more current draw between the alts and
| batteries, even if you are charging .5 volts above battery voltage, now
| increase the voltage to say 2 volts above the batteries and see how much
| the current draw increases at the alts over what it is at the amps, also
| note that there is still a load on the alternators even after you unkey,
| the more batteries you add the more current draw on the alternators. Now
| if you do not have enough alternator and are pulling down to battery
| voltage then you will see the voltage drop less with more batteries, But
| it will only wear your alternator out sooner by adding more batteries
| unless you charge right at battery voltage. If your alternator is just
| barely big enough to handle the job and it works fine with say one battery

| and you go in there and add 6 more batteries you will see less watts, now
| all of this is assuming the system is "truly" wired with enough conductor
| on both positive and negative sides of the system from the alternator to
| the amp.
|
| Now this my "simple example" and it has a very "simple concept" its called
| time tested truth, and not to be a knowitall but I will stand behind this
| one until the end.

2574. To cut the modulation limiter or not to cut....

Newsgroup: rec.radio.cb
Date: 1999-12-20 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <19991220132747.04192.00000573@ng-cf1.aol.com>
Source record: 16023

I have heard that if you cut the modulation limiter it will give you more modulation and make you sound super loud. I have read this in tune-up books as well.

I have also heard from people(Lou Franklin and others) that if a c.b. tech says to cut the limiter, run fast as you can. Furthermore stating that cutting the limiter causes distortion and doesn't really do anything positive to the radio, only causes damage.

Who is correct and why?

The President George radio has the best and cleanest RX out of any radio I have. It beat out all of my radios including my Yaesu and 2510. You also get a 45 watt (bird) output and probably the best SSB radio ever..

To much deadkey input wattage or he is turning it while he is keyed which arcs the pot inside. I think it is a 100 ohm.... Ask Toll..

Message-ID: <83lve1$jf0$1@ins20.netins.net>
Source record: 16032

Pat,
PLEASE,PLEASE,PLEASE, DON'T buy one of the CB/AM/FM antennas . They are just as bad as the horrible thru the glass antennas . There is no comparision to the Wilson , you are comparing apples to oranges. If you will let us know what specifications you need for you particular interest we will tell you what type of antenna you would be happy with.
If you want real performance and want everyone to look , just get a 108" stainless steel whip like I have on my Ford Ranger. I also run a base loaded hood mount when I am restricted to a certain height . Like in a parking ramp or through really low bridges.
Let us know your stipulations,
Tinker

there is a guy getting a mobile setup by davemade with a seperate motor in the back of an old panel truck. The motor's rpm will be electronically controled from the driver/operators seat , the full compliment of alternators will be mounted at the back of the motor with a short drive shaft and some large pulleys etc to spin the alts, less chance of breaking a crankshaft and all the HP right there of course there will be much more to it than this but this is where it is headed.

Everything would be done using the exact same setup, or for that matter all
test are done in the same vehicle which would prove to be the best way to
setup to win in a keydown.

OK,but the ads lead you to believe you can run the amp at the same
time as powering accesories,they would have to be damn small
accesories,you can't even use this for a big radio to drive the amp as
the PS is just adequate for the amp alone,what the hell,I still like the
amp for the price.

Look for a copy of "Yagi optimizer" I used it to get max forward from
a 13 element 14'boom @VHF and cried when it told me to remove 2 elements
but after adjusting the spacing the results were great.Somehow I lost my
copy.

No. In comparison to the tube amps of yesteryear, they are junk.

However, with what is on the market today, you might be better off with them rather than something else.

For a monoband amp, if you can afford it, the Tennesee Walker amps are great! Purchase one, and you should never have to purchase another tube as long as you live!

They are a pain to put up, as you want to put them in the Diamond configuration..

They do match down quite well.

They are "quieter" as far as picking up noise, but the signals you want to hear are just as loud as with a Moonraker type beam (Yagi or Quagi)... The shorted style of the antenna makes them work like the DC Grounded type verticals.

Hope this helps.

That is a common thing to do...

It has been being done since the 80s that I know of, and their are many
people that do it now.

I do believe Jay was joking about the Starduster coming in a close 6th behind the Window mount.

But I do have to agree with Jay about the Penetrator 500. If you've seen Jay's antenna farm going in the Mohave for his own R&D-T&E on his new and improved design of the P500 (the top-secret P500II), you'd agree with him as well. Antenna efficiency readings, radiation pattern, and all that jazz, man!

Otherwise, every individual has their favorites. Some like the Stardusters... others differ. I think HOMEBREW is the way to go. You go Jay!!!

137... back reading the neighbors paper!!!

Why would it be "hard to achieve the rpm's needed for what we do?"
Exactly how many RPM's do you turn your alternators at? What would be the
difference between audio amplifiers and RF amplifiers? Audio has more
transients and surges like SSB, but it also has larger surges than RF.
Audio equipment doesn't run at 18 Vdc, but the only difference there is
regulation. That particular Blazer ran 12 batteries I believe plus a load
of 1f stiffening caps. I forget what size hydraulic motor he had running
those alts, but with the proper pullies you could do anything.

I'm fairly new to the big amp and keydown thing so don't flame me for asking. Why doesn't everyone use AC for the big systems? It's easier to make AC than DC anyway. There are a few systems that use 200 amp Leeces to produce AC as well as regular battery charging. Isn't there more potential from and AC amplifier than DC. I'm just curious my dad and I were discussing this. We're in the hydraulics/generator/automotive electrical system business.

Well I have yet to see one at a keydown with this type of setup other than one that was close which was 55's chevy van I beleive he has a 350 chevy in the back but his alt's were mounted on the front of the motor not the back whcih can sustain the tremendous torque and I didnt see any electronics controling his motor's rpm etc Any idea how many 250's you can fit and run with this setup rather easily. Plus you don't have to worry about breaking down on the line from over reving etc and not being able to drive it home.

I am glad to see you men are getting ready for the Y2K onslaught. We may be in need of a person with radio experience. Your radio stations could be used as relays. We are trying to set up an early warning system.
The UN/NWO/AMISH forces are far more advanced than we expected. Can your radios JAM satellites?

Ebay pulled all auctions for linear amps in the CB section today at 4:00 P.M. even thought the item descriptions made no reference to them being used on CB frequencies . Their reason? THE FCC

Dear Storm Chaser (stormchaser478@webtv.net),
We regret to inform you that your eBay auction:
221891956 PALOMAR 225 LINEAR **NIB**
has been ended. All fees associated with this auction have been credited to your account. Please refer to the following page to review the items that are not allowed to be sold on eBay:
http://pages.ebay.com/help/community/png-list.html
We have been informed that your listing contains items which may be infringing or potentially illegal, namely, CB or certain linear amplifiers, which are in violation of FCC rules and regulations Part 95, Subpart D, section 95.411.
**IMPORTANT NOTICE: Please be aware future incidents of this nature can lead to the suspension of your account. If you have any question regarding whether or not an item is allowed to be sold on eBay, please write to us at moreinfo@ebay.com before listing the item. Multiple violations for listing prohibited items can result in the suspension of your account.
We thank you in advance for your cooperation.
Please feel free to contact us with any questions or concerns you may have on our existing listing policies.
Regards,
Juan eBay (ended@ebay.com)

Been there done that.... Replaced MANY 4 pins to five pins and used a 9 volt regulator in the radio and sent the positive to the mike via the extra pin.... Did the same with 5 pins also.... Expensive to some... but, there is nothing like knowing your microphone will not run out of juice, and will always be constant..... unless something goes "wrong".... of course..

Body handling: HTML body converted to readable text

If you build the motor right you dont have to worry about overreving unless you lose a couple of tubes at full throttle and take the load off of the motor without letting off the gas, Hell in ac sky you want dem volts to get dem watts so you hammer dat gas pedal, in dc you can use an adjustable rev limiter and then use a solenoid to open the throttle, you start out manually giving the vehicle gas and then move your foot off the pedal because the solenoid is keyed by the radio by giving a dc ground to a relay that controls the solenoid.
The controls for the adjustable rev limited are relocated inside the cab, this idea was not copied anywhere but from in my head and I can attest that it does work.

A single capacitor of this size and voltage would have a diameter
of about six inches and would be about 10 inches tall. It would
probably cost at least $80. I don't know if you could find one,
especially that cheap. However you can parallel to get the
value.

The best source that i know of for cheap electronic components
is M.E.C.I. or Mendelsons Electronics Corp. Inc. You can purchase
about 30 caps to get the 1 farad that you need. (120 amps?)
It will cost about $80

We have already thumb the idea around and did not see a real gain in doing this over the way we do it now, you are right, with the right pulleys you could do a lot, but I have yet to see a stereo setup that matches the equivalent to what some of the big charging systems consist of in keydowns, an audio amp works on a whole different concept than RF amplifiers do, you can lose volts on an audio amp and not see a significant drop in wattage like you will in RF amplifiers, our amps are not a " regulated" supply.

They have got enough alternator to run all the batteries, hell call them
and tell them, you want the phone numbers?

That is not what your saying, you didn't say shit until someone gave you
something to agree with, if you are such an educated guy you will see the
original point, with your "knowledge" you should have a dc amp meter lying
around that will read large amounts of current, do the original test
earlier in this post and then come back with an answer, but until you have
dealt with charging systems enough to do more than assume your right it
might be best to just read the mail.

Source record: 16111

Its not automatic, Wanker2222181234. It is a fact. Before the sales of Davemade stopped, no one ever posted that Exports was messed up. Ever since then, Exports R Us is seen as downers. Hmmmmmmmm...

I have nothing against Dave or Exports. Both I have done business with and both are very exceptional. But as soon as Steve started pushing the X-Force line, Exports became rejects. Don't tell me that Steve all of a sudden started missing orders, shipping orders late, or doing people wrong.

Now this Exportradios.com appears on the newsgroup. BADDABING! Exports R Us gets flamed. Any connection there?

Get real people!

The amp is a 10 out of 10. This amp is clean and will do true 300W average power with 10W average modulated. There are no appreciable (measurable) harmonics, I have a flat (ok 1.2:1 at a tuned 27.185MHz) SWR with a mag mount and a super penetrator antenna. The amp has been in use for only 6 months! I am upgrading to a 1200. The price is firm, $300 plus shipping. If you would like to see it in person I live in the Washington DC area. Email a response.

John

I would like a little input on the Quads that this company sells. does anyone own or has anyone ever used one of these antenna? Are they as good as they claim? Are they easy to match in? Im thinking about replacing my Moonraker 4 with something else in the spring.

I know enough to know that swing mods do nothing but make cbers happy because all they do is make meters swing. The modulation is no better than a carrier modulated up to 100%, however most cbers don't know that so ARRRRNGGGGG!! Thank you for playing even though you don't know the answer.

> peak watts. 1400 peak watts with a 200 watt carrier is over modulation..

To modulate a 200 watt carrier to 100% requires 100 watts of audio, the
peak power at 100% modulation is 4 times the carrier or 800 watts.

I use two garbage can lids with wet newspaper in the middle. the funny pages work well because the color ink makes an excellent insulator.

| A single capacitor of this size and voltage would have a diameter
| of about six inches and would be about 10 inches tall. It would
| probably cost at least $80. I don't know if you could find one,
| especially that cheap. However you can parallel to get the
| value.
|
|
| The best source that i know of for cheap electronic components
| is M.E.C.I. or Mendelsons Electronics Corp. Inc. You can purchase
| about 30 caps to get the 1 farad that you need. (120 amps?)
| It will cost about $80

I'll tell you what... the FCC has made it a 'mission' to crack-down on 11-meter amps, and ANYONE (hams,c.b.'ers) freebanding. I have been reading about it in Monitoring Times, and Popular Communications magazines. They (the FCC) just busted two 'hams' for operating on 27.425 LSB. Not only did they lose their license, but ALL equipment was confiscated! I don't intend for this to be a "scare-tactic," just the FACTS. So...use your gear wisely. In the 1970's, it was QUITE common to see the FCC vans in town! And that's what they want to get back to. Be CAREFULL.

You probably would want the batteries to filter out the extreme ripple
you would have from the alternator. Up to you, though. Keep it on 11
meters (CB) and it won't bother me.

I am wanting to get a CB for my car since I do a lot of driving. I hear Uniden CBs are the bast. I have a handheld that I've used in my car before, but only get a couple miles range with it on the car antenna. I want a good one that isn't handheld, but mounts in my car. I want to get one with some good range and ability to hook up to a PA system. Are PA systems still legal? Where can I get a good loud speaker? I'm sure there are some laws on having a PA system, but I'm not going to abuse it or anything. Also, the CBs you put in your car, can you hook them up to your car speakers? What is a good radio and antenna combination for somebody willing to spend around 150 dollars? Forgive me if these questions sound dumb, but I really don't know much about them. I'm just wanting something to do when I'm on the road. Also, I'd like an antenna that isn't magnetic. I remember my old one would come off of the top of the ar when I'd get up around 65mph. I'd like one that I could clamp to the trunk lid without damaging the car or paint job. If anybody has any suggestions for me, I'd appreciate the info! Thanks!

> If modulation of negative peaks exceed 100%, what will this do?

If the negative peaks exceed 100% you get distortion and splatter
because exceeding 100% modulation on the negative peaks cuts the carrier
off. You can exceed 100% modulation on the positive peaks (up to the
limits of what the power supply can handle) and get a good signal as
long as you don't let the negative peaks exceed 100%, but this takes
special circuitry. The typical cb swing mod kit dosen't do it. I repeat,
all the swing kits do is make cbers jump up and down and think they have
a "big radio" because they see all the meters wildly swinging.

I've been planning to build a test rig to check sweep tubes, and (hopefully) match them up into sets.

My question is this;

What plate, screen, and grid voltages should I use for testing a "typical" sweep tube (6JS6, 6LB6, 6GK6, others)? In matching, should I match for current draw or transconductance (or both)?

If posting a response, please respond to me by email as well.

Thanks,
Tom Mitchell

It won't hurt anything to remove this cap. It is primarily there
to stop rf from getting onto the hi impedance mic lines going to the
preamp.
If you want to lower the tonal response of the mic you could try
increasing the value of the cap a little at a time until you get the
tone that you want. You will need to turn the gain up as you lower
the tone because it will lower the output of the cartridge to the
preamp.
Personally, I wouldn't run one of these mics mobile as they do
seem to pick up hi freq. sounds like wind noises and such. That's
even with the gain turned down. Otherwise a good mic.
My personal preference is, as some one else posted, a 575 M6
Astatic. I've always had the best luck, with my voice, using that
mic.

Not sure on how high your radio goes but low-band commercial FM rigs
such as Motorolaï¿½ normally will operate on a portion of the 30 to 50
Mhz band.

The low-split ones tune from 30 to 37, mid-split from 37 to 42, and
high-split from 42 to 50 Mhz. Some of the rigs can be tuned out-of-band
with some modifications to cover the 10 meter and six meter ham bands.

Even if you could operate your cb above 30 Mhz, it would not be
type-accepted to transmit on business or public safety channels. I
suppose it may be possible to get a low-split radio to operate down at
27 Mhz but I suspect that several coils and capacitors would have to be
changed to move it that far out of band.

Hope this info helps.

Jim, W8EMS/9

Doesn't help me a bit. If you had posted here, you would have helped
"S.F.Gale". I have been on radio since 1977. I have a clue. Just because
I don't hold a ticket, doesn't make me stupid. BTW, a 2950 will go to
32 MHz. My mobile scanner starts at 29 MHz, and I've monitored dummies
using those frequencies on FM. Thanks for your thoughtful answer.

(That's the same holier then thou attitude I got when I stopped at the
Amateur Radio Center. Why do we keep having this ham vs CBer thing?)

I have seen Leece's burn up also. Why do you think that there are always so many " fresh rebuild's" available at the keydowns ???? Where does Leece get all of their cores to rebuild from ??? There are plenty of truck drivers that can attest that Leece's do burn out, and not from running mega-watts.

I just had a customer blow several batteries in a brand new van. It wasn't pretty. His regulator "slipped" and KA-BLOOEY !!!! Luckily, he wasn't physically hurt. His pocketbook is another story though.

What good is having a "mo-beel" that isn't mobile ? Gas prices aren't getting any cheaper and i have better things to do with my money.

Plan on worst case scenario and learn to do things the "overkill" method and you will minimize your problems AND get better performance. Sean

These are really good radios. I've used 2 for years. Install the required final it needs. Sorry don't know the number of the final, but I'm sure you can locate it on the web. Side band very strong, use a stock mike, swings to 25 watts. AM strong, use a good power mike if you want to sound loud, swings to 15. FM very stable. Use a stock mike. Solid 12 watts with no swing whatsoever, that's what you want on FM. This suggestion might not work for you but this is what I use & the output is what I get.

Just don't let the tech take the transistor out for modulation. You won't be able to use side band. Over modulate.

We have them too.

Here you go JJ, learn something new... I dont feel like re-typing and explaining.... That is what books (in which the authors receive nice amount of funds) are for.... go to the library...

Cut & Paste of what I have already mentioned:

"Swing Kit" - Exceeds 100% modulation on the positive modulation peaks (easily demonstrated on a "scope"), positive modulation peaks can and more than likely will exceed 100% modulation without producing distortion. This in fact increases the amplitude or power output of the CB.

Swing Kits will increase modulation......which in turn make you seem louder.....and despite this argument of due to lower carrier....etc....etc.... I have a question for all of you I suppose.... who the hell hears someone's carrier when talking skip?!?! Just a question....

JJ wrote in message <385F1CF8.3406@no.net>...

|>
|> If modulation of negative peaks exceed 100%, what will this do?
|
|If the negative peaks exceed 100% you get distortion and splatter
|because exceeding 100% modulation on the negative peaks cuts the carrier
|off. You can exceed 100% modulation on the positive peaks (up to the
|limits of what the power supply can handle) and get a good signal as
|long as you don't let the negative peaks exceed 100%, but this takes
|special circuitry. The typical cb swing mod kit dosen't do it. I repeat,
|all the swing kits do is make cbers jump up and down and think they have
|a "big radio" because they see all the meters wildly swinging.

Actually to be more precise; if negative peaks exceed 100% modulation,
harmonics of the modulation frequency will be produced. Not to mention
downward modulation.

Anyway..... everyone is open to their own opinions.... however, remember
your statement is just that..... You can "say" all day long that "swing
kits" do nothing, how about some proof. I would like to be objective about
this.... though I HAVE provided THE explanation as to WHY "swing kits" are
beneficial, and in fact -DO- something. Your turn...

Is Radio Luxembourg still broadcasting? We spent ten years in Germany
a decade ago, and we listened to Radio Luxembourg nearly every night (of
course, anything was better then the American AFN radio).

I was in Italy last year, but could not hear Radio Luxembourg because
of a strong local signal. I have tried to pull in their SW broadcast
here in the US, but I get nothing today (perhaps they have changed frequencies).

Message-ID: <83nn8s$oo3$1@nnrp03.primenet.com>
Source record: 16186

Hey Hank Aaron,

About 8 years ago I put a swing kit in a radio and it seemed to work with an amp quite well. Almost 3 years ago I got one from Copper Electronics in TN. I followed the instructions on the install and turned on my radio and it started to smoke. As I was removing the device I checked with the instructions to see if I put it in right. I did. The radio is a GrantXL (my personal favorite!). At this time I'm batting about .500. Most of my Grants are tuned -out to maximum peak wattage and turned to about 2 watts or less.

Question: What does a swing kit do that my method does not?

==========
Again I don't see the connection between davemade and xportsrus the people
complaining didnt get a radio or a palomar amp or something along those
lines. No one said anything about davemade or xforce why did you decide to?
Steve has been pushing the x force for quite sometime don't know where you
get this all of a sudden bs. As you should know when you get real busy its
hard to fill orders as quick as people want them. Ever wonder why you
sometimes have to wait to get amp from Dmade.

>

Thanks Tnm,
>ftp://ftp.funet.fi/pub/ham/antenna/yagim311.zip
I only found an earlier version.

It'd DOS based.
ugh.

I was born with a mouse and have never been able to get my head around
DOS.

How about one of you gentlemen out there putting in the figures I posted
earlier.

Thanks

Phil / UK

Jay, where are you?

Hi Dwight,
> Is Radio Luxembourg still broadcasting? We spent ten years in Germany
>a decade ago, and we listened to Radio Luxembourg nearly every night (of
>course, anything was better then the American AFN radio).
>
> I was in Italy last year, but could not hear Radio Luxembourg because
>of a strong local signal. I have tried to pull in their SW broadcast
>here in the US, but I get nothing today (perhaps they have changed frequencies).
Radio Luxembourg pulled the plug a few years back.

Lack of advertising revenue I believe to pay for the utility bill on
their 1.3 million watt tx!

Who listens to AM radio anymore anyhow?

Same thing is happening in the US I believe with some smaller stations
going quiet.

R. Luxembourg's transmitter is now back on air and on 1440Khz but I
believe they are being rented out to another organisation. Probably
another bible basher!

See ya

Try MCM Electronics. I bought six of the 1 Farad caps for $90 each.
Don't know if they still carry them or not-- these were ordered from
catalog 40A. The part # is/was 60-1925. The voltage rating is 20
volts-- may or may not work in your application.

If the D104 is amplified (most are) there is no issue with impedence matching. They work as-is. If the D104 is un-amplified, it is a high impedence, and would need a matching transformer. But I suspect that you would not be pleased with the audio level from the unamplified mike, on anything but a tube rig (they were also high impedence)

Ok, here's the REAL deal. Swing kits are more "form" than "function".
Yes, they can allow higher positive modulation, simply because they are
lowering the carrier. The peak power is the same as it was before.

The downside is that you can NEVER exceed 100% negative modulation. At
100% negative, you are at ZERO power. Increasing modulation only widens
the cutoff point. Modulation that is driven to cutoff will cause
distortion and splatter. That guy that bleeds you all 40 channels, is
probably running a badly butchered radio with a "swing kit".

As to the original question, "are swing kits beneficial?" The answer
depends on your objectives. If your goal is to be loud, obnoxious, and
cause interference to both neighbors and other Cbers, then the swing kit
will help. If you goal is just to put out a good, reasonably loud, but

CLEAN signal, then a swing kit will not do you any good. Trying to run one with the mod limiter still functioning defeats the purpose. You cannot take advantage of the huge positive peak without having to deal with the drawbacks of the negative cutoff.

There is a more complicated method called "controlled carrier" which allows the carrier ro rise in proportion to the modulation. Since the peak modulation is never more than 4 times the carrier(at its highest point), the negative cutoff can be kept right at 100%. But the apparent swing is still the same.

>

Actually in a properly tuned, symmetrical radio, 500 watts of carrier, with slight forward, or no movement would be peaking close to 2000 watts at 100% modulation (4X carrier power). A Bird meter tends to average the power, and the positive peaks will cancel out the negative ones. If both halves of the modualtion are symmetrical and equal, then there should be no movement during modulation. Any "swing" on an RMS meter indicates an imbalance in modulation. With an overmodulated signal, there is usually more "positive" modulation power than "negative" modulation power, since you cannot go below the zero power level at cutoff. As positive power continues to rise, it starts to show as forward swing, since you are now unbalanced. It may look good on the meter, but you are no longer "clean".

Negative swing happens when your amp does not have enough reserve to faithfully reproduce your peak positive modulation power proportinate to the carrier. The fix is simply to back down the drive power until the backward swing stops. Usually the point where the meter back swings to, is where you should then set the dead key power for, if you want to avoid further backswinging.

Shame the 101's were low level modulated..... But it does throw cold
water on the myth that low level radios don't have the "punch" that high
level ones do, all other factors considered.

I'd have to agree that I like the sound of old tube rigs, Trams,
Brownings, even old Laff-a-lotts.

The big secret to getting CLEAN modulation out of a modern CB is to
unlearn all that you've heard and read from "screwdriver tech" guides.
Leave the modulation limiter functional. Adjusting it for 100% or
slightly more, but not enough to cause squarewaves. Some radios have

audio bandpass filters, that make the audio sound "compressed". These can be worked over to allow a broader frequency response, and a better tonal match to your mike. Most of this stuff requires some test equipment. A scope, an audio signal generator, and meters.
And remember, more is not always better. Be conservative with the mike gain. A mike that can pick up a dog farting in the next room, will be too loud for your normal voice, and will clip and sound compressed. If you have a modulation meter, it should be peaking at or slightly above 100%, and spend most of the average talking time in the 60 - 70 % range.

This will not make you the loudest guy in the area, but when you talk, people will UNDERSTAND you, and your voice will not be hard to listen to.

While on the subject, do you think 2-1 farad caps will work for 200 amp transformer? Meaning do you think they will charge fast enough? And how many time the operating voltage do the cap need to be rated at? Just a few questions I wanted to through up in the air...

Agreed; the FCC was quite active in the '70's noting that I received notice that my aerial was 10 feet over the height limit. One recollection was sometime around 1980 when the FCC issued nearly 30 violations in a two week period in my community of 5000. It was plainly clear the FCC was intent on enforcing Part 95, further evidence of warnings received for operating QRP on abandoned RC freqs.. gasp, how times have changed.

I'll take the razor one. Does it supply it's own shaving cream when you key it up?

I think 137 has stumbled on the real deal (no pun intended) with this post. I find it real hard to believe that Steve would screw anybody. I have ordered thousands of dollars worth of gear and sent Many, Many people to him. I have never had a single problem. Time and time again he does what is right in a bad situation. UPS lost an item once. Steve shipped a new unit out the next day. Guys, Don't believe this crap you hear. Call the man on the phone and talk with him and you will see that the man has a good business sense.. He gets my business and I admit I am hard to please..

Not all audio amps are regulated like you think.. I used to volt a red Orion amp at 18 volts.. with a 1 ohm load.. Actually allot of the real IASCA competitors have damn good charging systems.. Plus IASCA installs are top class as far as appearance goes.. That Blazer ran 4 Punch 1000's just for the bass. Plus Many other items and amps.. Also consider that they have to runt hat stuff for an hour or more not 10 seconds. That's why you generally see more reserve power in a high watt audio system...

It was going on a month that I was waiting for my amp to come in. I was getting worried that I had lost my money dealing with this company.. But, the amp came in and it was in perfect condition.. What had happened is that the package got stuck at a major UPS bulk terminal.. It had nothing to do with Exports R Us, they had shipped as agreed..

We understand that. That's why I stated that " 1400 peak watts with a 200 watt carrier is over modulation.." Or reduced carrier AM....

I guess I did not make my self clear and I apologize. I was just trying to state that if you stand still on an RMS meter you are still producing 1400+ watts of peak power if you are using a bird meter.

> "clean".

True.. I did state "bird 43". I was using the Bird figure of 2.828 times RMS to get peak just to prove a point. The original post said 500 RMS watts. Prozac said 0% mod if he was holding steady at 500. I was just letting him know that this was not the case..

>
>
> Negative swing happens when your amp does not have enough reserve to

Or reduce the carrier so there is room. That way you still get the peak out..

> Usually the point where the meter back swings to,
> is where you should then set the dead key power for, if you want to
> avoid further backswinging.
>

Good point... Or use a peak meter and tune for the general "rule" of 1/4 or peak..

Not the full potential of the system but still you are right. Dropping back on and RMS meter does not mean that you are going to sound bad or pinched in this particular setup. Look on the scope or try a peak kit in the bird. He still has 1400+ peak watts with that 800 watt carrier..

MC Turner

JJ is missing the point. Somebody once told him that swing kits are no good for any purpose. So he believed it. He probably has no electrical or RF theory to back it up.... JJ lets hear your explanation of why Reduced Carrier AM operation is not beneficial in any situation. Also explain to us exactly why you think it makes no difference on the receiver of the other station....

MC Turner

2779. Cobra 250 Xl amp--need tech info

Newsgroup: rec.radio.cb
Date: 1999-12-21 00:00:00 UTC
From: petiemeow@aol.comcast.com
Message-ID: <19991221111009.10010.00000810@ng-ch1.aol.com>
Source record: 16228

Hey all.
Does anybody have the schematic for the Corbra 250 XL?
SWR at full power is 1.5:1. But as I switch the power down (4 selections), SWR goes up and up and up.
High - 1.5:1
Med/High 2.0:1
Med/Low 3.0:1
Low 5:1
Off 1.1:1

It's Very confusing, I don't really want to run an amp at all, DX conditions right now seem to require a bit--so I was hoping for a way to modulate the power back from full--but this box seems to be holding the power down by reflecting it back to the finals.
So, I'm looking for schematics, owners/operators manual and such.

Thanks all.

Please post all replies to the newsgroup--the email address is bogus.

And you can "say" all day long that "swing kits" do something, but the
proof is that a swing kit does nothing more that what a full carrier
with good modulation will do. Just keep on believing your cb myths as
that is what cbers are good at.

I have over 40 years experience in electronics and radio communications,
it has been explained many times, cbers refuse to believe it. Go back
and read Dave's posts, he explains it well, if you can't understand that
then you can't be helped.

Gee, Must of hit "mail to:" instead of "respond". Hope my mistake didn't run your day.

I don't see this as a ham vs. cb question. Nothing was ever said about operating in the ham bands. Guess legal vs. illegal operation is going to always be a ham vs. cb thing? Sorry, but I know a lot of cb'ers who operate legal - and a lot of hams that operate illegal. It depends on the person, not the license they hold.

Guess my point would have to be this. Maybe the radio will transmit up to 32 Mhz. Unlike 27.405 to 28.000 Mhz, between 29.7 and 32 Mhz there are various legal services operating, including business, the federal government, and state conservation officers - as in "law enforcement".

While operating on a business channel probably wouldn't cause you a whole lot of grief, sitting down on a state conservation channel would most likely bring you more hate and discontent than you can imagine. Seems like most cops have little sense of humor! And you definitely don't want to deal with operating on federal government radio frequencies.

BTW, I wasn't trying to upset anyone. Just trying to honestly answer a question. Sorry if that offended you.

Or if you are using the kit to tune the radio to an amp. Allot of radio/amp setup would benefit from a swing kit so there output is is More towards the linear side but with good peak power.. That's the main purpose of the kits in my opinion..

> If you goal is just to put out a good, reasonably loud, but
> CLEAN signal, then a swing kit will not do you any good.

Unless you are dealing with an amp that likes a low deadly but will benefit from good peak input power..

> Trying to run
> one with the mod limiter still functioning defeats the purpose.

Maybe, maybe not. You can run a limiter with my kit. Just adjust the AMC correctly. Some radios really do not want to produce much peak from a low carrier.

Plain and simple: RMS orPEAK

The only inteligent part of an AM signal is the modulation not the carrier. right?

Now if you can swing your radio to swing from 90 to 100 watts you only have 10 watts of inteligent signal. Right?

No is you reduce this waisted carrier you say 5 watts and with a "swing kit" still swing to 100 watts you now have 95 watts of inteligent signal. Right?

95 watts of inteligent signal is better then 5 watts of inteligent signal. Right?

On most radios with out a "swing kit your modulation will clip off at such a low carrier.

This means if you key 500 Peak And swing to 500 Peak you have no modulation on AM mode.

I guess that like saying from (point A to point B) or (point A to point C) are both 5. If not specified it would mean they are both the same distance. unless I said one is 5 Ft and the other is 5 inches.

-
Your statements prove you understand nothing about it. Reducing the
carrier to 5 watts and swinging to 100 gains you nothing more that
having a 100 watt carrier fully modulated. You obviously understand
nothing about how modulating a carrier works.

Get it straigt, you say when you talk wattage you only talk peak or RMS
then you say not both. Then you say if not specified it means either RMS
or peak. So which is it? Maybe you need to take a little more of that
prozac.

Take your bullshit scare tactic lies
somewhere else. You don't scare anyone
here. Lost licenses? Confiscated Gear?
OH REALLY? Please state the call letters
and names of the hams you are talking about!
AND the source of your information.

FACT: The FCC downsizing in 1996 resulted
in the permanent closing of ALL monitoring
stations. Mobile monitoring operations ceased
four years before that. Since 1992, the FCC
budget has been slashed to a quarter of what
it was. Manpower is a third of what it was.
They can't control ham radio , where they
use call signs, and you think they can enforce
CB? YEAH Right! The one guy doing ham
enforcement, Riley Hollingsworth, admitted
on the air that he is doing it from his home.
He copies down the CALL SIGN of the station
breaking a rule(s), then writes them a
warning letter. He has done NOTHING
about the hundreds of unidentified jammers
on the ham bands, because he can't. He
has no way of locating or identifying them.
H AH AH HA HA HA HA CB enforcement,
RIGHT! More CB linears change hands
in one weekend in Chicago than the FCC
could ever dream of confiscating.

If you the output is a steady 500 watts, than yes, you have no
modulation, but if you apply audio and the carrier swings, it is
modulated. What you say above dosen't even make sense.

They got what they deserved, it is pretty stupid to go to the effort to
obtain a ham license and then operate illegally when you have all the
ham bands where you can operate and be legal. As Forrest Gump would say,
"stupid is as stupid does."

Message-ID: <83on0c$o8l$1@nntp9.atl.mindspring.net>
Source record: 16260

Miles,

The Grant XL is within the list of radios that carry with it a "swing kit" exception.... I would not recommend anything more than buffering its limiting transistor and a good peaking..... Grant XL's are GREAT radios alone..... I have one, I love it.... If though, it is a good idea to make reference to CB brand name and models... Then, one radio that utilizes the "swing kit" wonderfully is the Cobra 25/29 LTD....

To answer your question with more detail.... I myself and not referring to pre-fabricated/mass produced "swing kits" as most of them do NOTHING. If you have that Papa/Mama Modulator with you, carefully take a hammer and bust it up.... I believe I read it is only a RESISTOR in the whole epocy shell..... wires such as the positive, negative and mic input aren't even used..... Pretty funny I think..

Miles Davis wrote in message <83nn8s$oo3$1@nnrp03.primenet.com>...
|Hey Hank Aaron,
|
|About 8 years ago I put a swing kit in a radio and it seemed to work with
an
|amp quite well. Almost 3 years ago I got one from Copper Electronics in TN.
|I followed the instructions on the install and turned on my radio and it
|started to smoke. As I was removing the device I checked with the
|instructions to see if I put it in right. I did. The radio is a GrantXL (my
|personal favorite!). At this time I'm batting about .500. Most of my Grants
|are tuned -out to maximum peak wattage and turned to about 2 watts or less.
|
|Question: What does a swing kit do that my method does not?
|

|
|Or if you are using the kit to tune the radio to an amp. Allot of
radio/amp
|setup would benefit from a swing kit so there output is is More towards
the
|linear side but with good peak power.. That's the main purpose of the kits
in my
|opinion..
|
|> If you goal is just to put out a good, reasonably loud, but
|> CLEAN signal, then a swing kit will not do you any good.
|
|Unless you are dealing with an amp that likes a low deadly but will benefit
from
|good peak input power..
|
|> Trying to run
|> one with the mod limiter still functioning defeats the purpose.
|
|Maybe, maybe not. You can run a limiter with my kit. Just adjust the AMC
|correctly. Some radios really do not want to produce much peak from a low
|carrier.
|

Oh grow up "dick rider." I am not going to get pissed at Dave's post
because simply it showed intelligence.... Not just a "this is my opinion and
I dont know why" post such as yours was.... I see you still haven't given
me your reply yet.....

Baa-bye

Which is the whole point of the discussion!
You have a call sign and your name and
address are in the FCC's data base.
No call sign, no problem. They don't
know who you are or where you are
and they have no way of finding you,
unless they want to spend a whole bunch
of money. The FCC busts a couple
of CBers, then make a BIG publicity
splash hoping it scares everyone. The
truth is they do not have the money or
manpower or equipment to go after
millions of CBers. they're having enough
trouble trying to close down a few dozen
low-power FM (unlicensed) stations
around the country. they caught some
nut in Atlanta jamming commercial aircraft.
It cost them so much money that they had
to ask for a special congressional
supplement to their budget this year.

|> kits" do nothing, how about some proof. I would like to be objective
about
|> this.... though I HAVE provided THE explanation as to WHY "swing kits"
are
|> beneficial, and in fact -DO- something. Your turn...
|
|
|Ok, here's the REAL deal. Swing kits are more "form" than "function".
|Yes, they can allow higher positive modulation, simply because they are
|lowering the carrier. The peak power is the same as it was before.
|
|The downside is that you can NEVER exceed 100% negative modulation. At
|100% negative, you are at ZERO power. Increasing modulation only widens
|the cutoff point. Modulation that is driven to cutoff will cause
|distortion and splatter. That guy that bleeds you all 40 channels, is
|probably running a badly butchered radio with a "swing kit".
```

|
|
|As to the original question, "are swing kits beneficial?" The answer
|depends on your objectives. If your goal is to be loud, obnoxious, and
|cause interference to both neighbors and other Cbers, then the swing kit
|will help. If you goal is just to put out a good, reasonably loud, but
|CLEAN signal, then a swing kit will not do you any good. Trying to run
|one with the mod limiter still functioning defeats the purpose. You
|cannot take advantage of the huge positive peak without having to deal
|with the drawbacks of the negative cutoff.
|
|There is a more complicated method called "controlled carrier" which
|allows the carrier ro rise in proportion to the modulation. Since the
|peak modulation is never more than 4 times the carrier(at its highest
|point), the negative cutoff can be kept right at 100%. But the apparent
|swing is still the same.
|
|
|Dave
|"Sandbagger"
|
|

Dave,

Usually in a "swing kit" the collector of the final receives a burst of positive voltage, which is in phase with the positive modulation swing. This added DC voltage causes the final to amplify to a greater extent and increase transmitter output power in step with the positive peak modulation.

As far as interference, etc, etc.... I suppose if someone disables their limiter then, they might as well make use of the swing kit.... which is beneficial..... does it give the appearance that they are louder? I say yes.... if yes is the answer, then its safe to say it has a benefit.... this debate/argument is NOT over the fact of how good the benefit is or is not

Take care
Hank

Reason is that some people like "pingers".... and if something is set to constant receive as is the case most of the time..... hmmm.... you have a good idea.... but now that -I- thought about it... I think in my situation it would be best to keep to what I do already... since a lot of radios/chassis are different, I believe it would entail more "thinking" than the process I perform already. Know what Im saying? Let me know if that came out right...

Unable carry on honest discussion, eh? I have been in CB and HAM for
more than 30 years. Seen a lot. IMHO, you are the one biased against
hams. As far as me being narrow minded, try reading the CFR and putting
it into the reality of the world.
Happy Holidays de Martin N5PZJ

Boy do you have that last part right!

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN........

2830. Re: Cobra 250 Xl amp--need tech info

Newsgroup: rec.radio.cb
Date: 1999-12-21 00:00:00 UTC
From: petiemeow@aol.comcast.com
Message-ID: <19991221160826.01590.00000014@ng-cg1.aol.com>
Source record: 16279

I just tried it with a dummy load and the SWR was perfect 1.0:1.0 accrose all power settings.

Strange. Is the dialectric in the cable (rg58) breaking down as I increase the power? What's going on here?

again, please reply by posting, the email address is bogus.

2831. Re: This place reminds me of:

Back in the day they did used to run their equipment for a good period of
time but now the only guys with large charging systems I have seen are the
SPL guys and they only crank for a couple of seconds at a time
"DB DRAGS", Most of the SQ guys run a large alternator in the factory
location, They have a voltage limitation at a lot of these functions

Not nearly as many as they run, I believe the less the better, let your
alts do their job with out having to keep all the batts up to snuff, there
is goods and bads both ways.

```
It doesn't take that many batts to filter the ripple, and please explain
to me what ripple will do that would make you say "keep it on 11 meters
and it wouldn't bother you"?

If you use an RMS meter this is just simply incorrect. I explained that and
even gave you the calculation for the industry standard meter..

>
> I guess that like saying from (point A to point B) or (point A to point C)

holding 500 RMS watts is swinging forward to over 1400 peak watts... Read the
bird manual..

2855. Re: watts vs swing

Newsgroup: rec.radio.cb
Date: 1999-12-21 00:00:00 UTC
From: MC Turner <c_turner@ix.netcom.com>
Message-ID: <386007BD.641B9713@ix.netcom.com>
Source record: 16304

The original post stated a deadkey of 500 RMS with no movement on the meter.. Or holding 500 on voice. The RMS is the key to this. 500 RMS modulated watts is 1400 peak..

MC Turner

JJ wrote:

>many time the operating voltage do the cap need to be rated at? Just a few
>questions I wanted to through up in the air...

A power supply that will be used for a linear amp should keep the
ripple to 5% or less at full current draw. With a capacitive input
supply this can be accomplished with about 1 farad per 100 amps.

The peak voltage of a capacitive input bridged supply will be about
1.55 times the average voltage. If the average voltage is 12.6 volts
at 100 amps then the peak voltage under no load conditions will be
about 19.5 volts. I wouldn't recommend using 20 volt caps. Use at
least 25 volt caps for this type of supply.

If you can find an appropriate input choke you could reduce the no
load voltage and at the same time reduce the need for this much
capacitance. You can further reduce the no load voltage by including a
bleeder resistor. Shoot for 10% of the full load current. Either one
of these methods can reduce the no load voltage low enough to
facilitate the use of 20 volt caps. Remember that a bleeder that
shunts 10% of 100 amps will dissipate 150 watts at 15 volts.

Hello Mr137: Yes I was kidding around with that one. I got about 8 e-mails on that one. I figured everyone would take it as tongue in check humor, but this text written stuff doesn't convey the same meaning as being there telling it, to someone.

The New Design 5/8 Base Station Antenna, really isn't "Top Secret" it just has at this time 3 or 4 Proto-Type Configurations. The one you saw (we don't need to get into details here) was #2, and and now #4 is up and being tested. I have duplicated the Penetrator 500's performance, but now want to make it a little more broad band, and stronger.

I have been asked to write a article on all the how raw, more on this later......

Jay in the Mojave

> I do believe Jay was joking about the Starduster coming in a close 6th
> behind the Window mount.
>
> But I do have to agree with Jay about the Penetrator 500. If you've seen
> Jay's antenna farm going in the Mohave for his own R&D-T&E on his new and
> improved design of the P500 (the top-secret P500II), you'd agree with him as

I've found Kenwood to be very reasonable,when I bought my FT-2500's
they were the most expensive 2 meter FM mobiles out there but they
worked in the high RF environment I live in.....can't say that for the
radio shack,Icoms,and others I have tried here.
I also have an old TS430S that is a plain jane workhorse I got used
for $325,my TS850S/AT with DVR and everything is ...well a TS850!

You can get some Fiberglass Resin and Fiberglass cloth at you
local auto parts store. Cover it with that and let it dry.
Several layers may have to be applied to get the strength you
need. Sand it down and paint it. Now you have a new antenna
again. (well almost)

And while we're at it, there is a bill in the Senate right now that would give LOCAL authorities (police/sheriff) the ability to conduct station inspections as a result of complaints. Feel-free to read about it at http://home.att.net/~uscb_association/ If this bill passes, there will suddenly be THOUSANDS of potential inspectors working indirectly for the FCC.

I was told by a local shop that the newer Galaxy radios are better than the old ones. They didn't say how they are better, just that they don't see as many in for repairs as before.

My question is, what was changed in the 77 88 and 99 SSB mobiles, and how is their SSB audio? Do the newer ones have the drifting problem on SSB? I might be interested in a 99V.

thanks, Dave

I would have to say you haven't done your homework... Radio Shack is not cheap, or at least I dont think so. Look in the phone book, do some research.... You obviously have web access so use a search engine and PRICE!!

www.bills2way.com

is one of many..... but the only one I know over the web.... (at least the correct URL to)

None wrote in message <386042d2_1@nntp2.nac.net>...
|My budget is limited so Ive been thinking about getting a Radio Shack CB
|which one would be worth geting so that I can modify it to get extended
|coverage to freeband??

I have bought several Items from steve at exportsrus and have never had one problem.
He has always answered all my questions on the phone and thru emails.
I hope they stay busy, because I would prefer they stay around for awhile.

Message-ID: <dNQ74.7279$mv4.369828@news.rdc1.nj.home.com>
Source record: 16356

ha ha ha you just totally made no sense. 100 watts carrier fully modulated?
The carrier is 5 watts the modulation or swing or peak or intelligence is
100 watts give it up!!!!!1

"JJ" <jj@no.net> wrote in message news:385FB292.103B@no.net...

Get a Uniden PC122XL and a Wilson 500 magmount antenna. That'll run
you around $150.00. Don't worry, this magmount will not come off your
car at highway speeds.

>
>FACT: The FCC downsizing in 1996 resulted
>in the permanent closing of ALL monitoring
>stations.

Correction, Ernie. The monitoring facilites are remote-controlled from Columbia, MD. They are quite active. Ask the ham in Asheville NC who's in the "hot seat" at the present time as a result of DFing by FCC.

> Manpower is a third of what it was.
>They can't control ham radio , where they
>use call signs, and you think they can enforce
>CB?

We refer you to earlier reports on the FCC bust of gypsy cabs in NYC, where they were using 10 meters for dispatching.

> The one guy doing ham
>enforcement, Riley Hollingsworth, admitted
>on the air that he is doing it from his home.

Not according the the article (with photos) in QST last year.

What you've written is what you WANT it to be. But you are way out of step with reality. Get a subscription to a couple of good radio mags (Pop Communications, QST, CQ) and check the FCC web site occasionally for updates.

> More CB linears change hands
>in one weekend in Chicago than the FCC
>could ever dream of confiscating.
>
>

Talked to your buddy at Andy's Electronics (Houston) since he was busted?

The best way for a CBer to attract attention remains:
(1) Transmit on frequencies belonging to another radio service.
(2) Interfere with granny's telephone or television.
(3) Sell linears at a large hamfest. Dayton is ideal.

Or, you can keep a low profile and probably continue operating as you are for a long time.

We did sell the Davemades. Never had a problem with them except the building process and delivery was slow. The boxes did great, just as equal as the x force units. X Force would send the units overnight at no extra charge to make sure the orders got taking care of. Postal is not always the best way to ship and that is how the Davemades were sent. As for the card not being credited, we don't even know who this guy or woman is. Check the status of business and not hear say.

Here we go again.
I just got off of eBAY. Guess what? You can still bid on amps in the CB category. For now any way. A few have been remove, but over 45 items are still up for bid.

As far as the FCC is concerned, they will bust anyone they can, as long as it doesn't fall out of budget, and they can do so without leaving the home office. They do not go after anyone. They only act on complaints. Notice plural! More than one complaint! Them they send you mail. If you persist. They again send you a notice. Keep it up and you are searved to appear in court. A local prosecutor will handle it, and you will never get to meet any one employed by the FCC. You have many tries to get it right.

Now for then plublications who print the latest " who got busted this month ". 3 to 5 guys busted a mounth is not something to get all worried about. Think about it. Most of us could bust more than that daily if we had the authority.

From: rjchen@leland.Stanford.EDU
Message-ID: <83pkv3hre1@nntp.Stanford.EDU>
Source record: 16406

Would keying a 4 watt handheld about 15 feet from an RCI
2950 (or its antenna anyhow) overload its receiver? I'm worried I might
have blown a diode or something like that. Is this a situation in which
it's blown or not? or are there varying degrees of damage I can do to the
front end that cause varying degrees of loss of sensitivity?

Thanks,
-RC

: Key up 800 watts and drop down to 500?
: What do you call it?

Not a heavy enough power supply to handle the modulation.

Either that, or severe clipping of the "negative" half of the
modulation waveform.

John J. Gervasi (jgervasi@bellatlantic.net) wrote:
: modulation compression. The way to solve this problem is to minimize the dead
: key and swing 6 to 12 times the dead key. I have seen a 2950 dead keying at 1W
: and swinging to 16W driving a TX 667V from 80W to 300W. Not very linear is it
: :-) But the detectable signal is superior. Of course, if you over drive the
: amp with too high a drive you still get compression and that choked sound.

I suspect that, if you looked at the signal on a spectrum analyzer, you would see that there was about 8 watts in the carrier, and about 4 watts in each sideband.

In most cases, "swing" means nothing - as the carrier increases with the modulation level.

Chances are that your average power is "back-swinging" when modulating
although your peaks show signal growth. Since the field strength meter does
not measure peaks and works off of average levels, it will reflect the lower
average power when modulating. Sean

: DAVEMADE (joke. Just kidding...). Okeedokee? Laterz BOO!

It is not correct. "Backswing" has nothing to do with reflected power.
Backswing is a result of clipping the modulation - or the carrier being
reduced because the power supply is not strong enough to supply the
power needed for both the modulation level and maintain the carrier.

Reflected power is only a function of the coax to antenna impedance match.

prozac 625 (xeroeightytwo@aol.com) wrote:
: Plain and simple: RMS orPEAK
:
: The only inteligent part of an AM signal is the modulation not the carrier.
: right?
:
: Now if you can swing your radio to swing from 90 to 100 watts you only have
: 10 watts of inteligent signal. Right?

Not quite. With 100 watts peak modulated signal, you have approximately
50 watts of carrier and 25 watts in each sideband. Only one of the sidebands
is used on receive - so there is 25 watts of useful signal.

That is why SSB has a theoretical 9 dB advantage over AM. All that 100
watts goes into the modulation on one sideband - 6 dB gain. There is an
approximate 3 dB additional improvement by the receive bandwidth being
half as wide.

: No is you reduce this waisted carrier you say 5 watts and with a "swing kit"
: still swing to 100 watts you now have 95 watts of inteligent signal. Right?

Not of the signal is undistorted. You have 100% positive and 100% negative
modulation. The result is 50 watts carrier and 25 watts in each sideband.
The result is exactly the same as the radio where you start out with a
dead key of 50 watts.

The only difference is that the s-meter needle and wattmeter needle swing
wildly - so you think you have a stronger signal.

: Why not replace the boom on the MR4 and add some more elements. Its not hard to
: do and only cost about $100. I have the info on how to do it and will post when
: I find.

It is basically easy. Make the boom at the director end the length of the boom from the driven element to the director end of the boom. (It can actually be a bit shorter than this without affecting things much.

Cut two more directors - the one to be mounted closest to the existing elements about 5% shorter than the shortest director - and the new end director about 10% shorter. None of these measurements are critical, the new elements add very little in gain. You shouldn't even have to retune the beam.

It sounds like the meter that swings forward is the radios own meter. This meter can swing forward even though you are losing wattage as you speak. The reason this occurs is the meter is not hooked up as a simple output metering circuit. If you used a simple output metering circuit (external wattmeter) it should show the same as the simple output metering field strength meter.

I agree completely with this post abt getting what they deserve!! Why go to all that trouble and then free band? Makes no sense to me.... Besides you can talk all over the world right now with only a few watts. Duh?

From: Joe 2NC605 <2nc605@usa.net>
Message-ID: <83r3dnuiq1@nnrp1.deja.com>
Source record: 16451

The formulas you attempt to give are for volts and do not apply
driectly to watts.

I think you meant to say

Peak is RMS / 0.707
Peak is RMS * 1.414

or

RMS is Peak * 0.707
RMS is also Peak / 1.414

Dont forget this is the conversion formula for voltage and thus the
current. Wattage is found by multipling both.

0.707 * 0.707 = 0.5 RMS power is 1/2 of Peak
1.414 * 1.414 = 2 Peak Power is twice RMS

This is only true for sine waves.

In a small Southern town there was a Nativity
scene that showed great skill and talent had gone into creating it.
One small feature bothered me. The three wise men were wearing
firemen's helmets. Totally unable to come up with a reason or
explanation, I left.

At a Quik Stop on the edge of town, I asked the
lady behind the counter about the helmets. She looked skeptically at
me, "You Yankees never do read the Bible!" I assured her that I did,
but simply couldn't recall anything about firemen in the Bible.

She jerked her Bible from behind the counter and
ruffled thru some pages, and finally jabbed her finger at a passage.
Sticking it in my face she said, "See, it says right here, 'The three
wise men came from afar.'"

3004. A Joke from ICECOLD

Newsgroup: rec.radio.cb
Date: 1999-12-22 00:00:00 UTC
From: icecoldnyc@aol.comICECOLD
Message-ID: <19991222085154.15519.00000246@nso-fq.aol.com>
Source record: 16453

There were these friends who played golf together every Saturday. One Saturday they were getting ready to tee off when a guy, by himself, asked if he could join them. The friends looked at each other and then looked at the guy and said, "Sure."

So they teed off. About two holes into the game, the friends got curious about what the guy did for a living. So they asked him. The stranger told them he was a hitman. The friends all laughed.

The guy said, "No really, I'm a hitman. My gun is in my golf bag. I carry it everywhere. You can take a look at it if you'd like."

So one of the friends decided to check it out. He opened the bag and, sure enough, there was a rifle with a huge scope attached it. He got all excited and said, "WOW! I bet I can see my house through here! May I look?"

The hit man replied, "Sure."

So the guy looked for a second and said, "YEAH! I can see my house! I can even see through the windows into my bedroom. There's my wife, naked. Isn't she beautiful? WAIT! There's my next-door neighbor! And he's naked too!"

This really upset the guy, so he asked the hitman how much it would be for a hit. The hitman replied, "I get $1000 every time I pull the trigger."

The guy responded, "One thousand dollars? Well, okay. I want two hits. I want you to shoot my wife right in the mouth. She's always nagging at me and I can't stand it. Second, I want you to shoot my neighbor in the penis, just for screwing around with my wife."

The hit man agreed. He geared up and looked through the scope. He was looking for about five minutes until finally the man started to get really impatient and asked, "What are you waiting for?"

The hitman replied, "Just hold on ... I'm a about to save you a thousand bucks!"

The 1st couple to be shown in bed together on prime time television were
Fred & Wilma Flintstones.

Coca-Cola was originally green.

Every day more money is printed for Monopoly than the US Treasury.

The Hawaiian alphabet has 12 letters.

Men can read smaller print than women; women can hear better.

City with the most Rolls Royces per capita: Hong Kong

State with the highest % of people who walk to work: Alaska

% of Africa that is wilderness: 28%
% of North America that is wilderness: 38%

Barbie's measurements if she were life size: 39-23-33

Cost of raising a medium-size dog to the age of eleven: $6,400

Average number of people airborne over the US any given hour:
61,000.

Intelligent people have more zinc & copper in their hair.

The world's youngest parents were 8 & 9 and lived in China in 1910.

The youngest pope was 11 years old.

1st novel ever written on a typewriter: Tom Sawyer.

The San Francisco Cable cars are the only mobile National Monuments

Each king in a deck of playing cards represents a great king from
history.
Spades - King David, Clubs - Alexander the Great,
Hearts - Charlemagne, Diamonds - Julius Caesar.

111,111,111 x 111,111,111 = 12,345,678,987,654,321

If a statue in the park of a person on a horse has both front legs in
the
air, the person died in battle; if the horse has 1 front leg in the air,
the person died as a result of wounds received in battle; if the horse
has
all four legs on the ground, the person died of natural causes.

Only 2 people signed the Declaration of Independence on July 4th, John Hancock & Charles Thomson. Most of the rest signed on August 2, but the last signature wasn't added until 5 years later.

"I am." is the shortest complete sentence in the English language.

The term "the whole 9 yards" came from W.W.II fighter pilots in the South
Pacific. When arming their airplanes on the ground, the .50 caliber machine
gun ammo belts measured exactly 27 feet, before being loaded into the fuselage. If the pilots fired all their ammo at a target, it got "the whole
9 yards."

Hershey's Kisses are called that because the machine that makes them looks like it's kissing the conveyor belt.

The phrase "rule of thumb" is derived from an old English law which stated that you couldn't beat your wife with anything wider than your thumb.

The Eisenhower interstate system requires that 1 mile in every 5 must be
straight. These straight sections are usable as airstrips in times of war
or other emergencies.

The name Jeep came from the abbreviation used in the army for the "General Purpose" vehicle, G.P.

The cruise liner, Queen Elizabeth II, moves only 6 inches for each gallon
of diesel that it burns.

No NFL team which played its home games in a domed stadium has ever won a
Superbowl.

The only 2 days of the year in which there are no professional sports games
(MLB, NBA, NHL, or NFL) are the day before & the day after the Major League All-Star Game in July.

How about this....The nursery rhyme Ring Around the Rosey is a rhyme about the plague. Infected people with the plague would get red circular
sores ("Ring around the rosey..."), these sores would smell
very badly, so common folks would put flowers on their bodies somewhere (inconspicuously), so that
it would cover the smell of the sores ("...a pocket full of posies..."), People who died from the plague would be burned so as to reduce the possible spread of the disease ("...ashes, ashes, we all fall down!")

Q. What occurs more often in December than any other month?
A. Conception.

Q. What separates "60 Minutes," on CBS from every other TV show?
A. No theme song.

Q. Half of all Americans live within 50 miles of what?
A. Their birthplace.

Q. Most boat owners name their boats. What is the most popular
boat name requested?
A. Obsession

Q. If you were to spell out numbers, how far would you have to go
until
you would find the letter "A"?
A. 1000

Q. What do bullet proof vests, fire escapes, windshield wipers & laser
printers all have in common?
A. All invented by women.

Q. This is the only food that doesn't spoil.
A. Honey

Q. There are more collect calls on this day than any other day of the
year.
A. Father's Day

Q. What trivia fact about Mel Blanc (voice of Bugs Bunny) is the most
ironic?
A. He was allergic to carrots.

Source record: 16455

Bill,

43 = +/- 5% of full scale

Digital 4391's have the same accuracy figures.

It's only in the 'lab grade' department that you can improve to 3% but
at what cost?

Going to Birds extreme of +/- 1.25%, you're talking their best
calorimeter which, at this accuracy offers power measurement of up to
only 200w.

Hardly suitable for your average Texas Star operative.
>The Bird digital wattmeter is far more accurate than the analog version.
>It reads the same power as a thermocouple type meter would read.
>
Stick with the 43:-)

Phil / UK

So let me get this straight, you think this country sucks because a
business will not support or condone openly illegal acts?

Do you think they should defy the law? Maybe we all should? Anarchy!
Yea, that's the ticket!

People make a choice to do what they do. If you cannot get help for
illegitimate activities, through legitimate channels, then you have to
"adapt". Don't blame the system for following the rules.

Actually what happens in most "high level" radios (like the Cobra 25/29)
with "swing kits" is that the driver's DC collector current is limited
by a resistor, which lowers the carrier power. The resistor has a
capacitor in parallel to it. This capacitor allows the AC component (AKA
the modulation) to bypass the resistor, and allow the full modulation
swing.
The total modulation swing (peak power) is no higher than it was before
the swing kit was added, but now since the carrier is lower, the RATIO
between carrier and modulation has increased, and the modulation
amplitude is greater, which DOES increase your loudness. No arguement
there.

>
> As far as interference, etc, etc.... I suppose if someone disables their

>

That's why I tried to define the term "benefit" before. If your goal is pure loudness, at the expense of clarity, RFI, splatter etc. then yes, it has a benefit. IMHO though, that is not a benefit, since the downsides far outweigh the advantages.

Sigh. Another example of people that don't understand the "big" picture.
Martin, you're wasting your time. Some people think that the FCC can
create a "worldwide DX CB band" with the stroke of a pen, without due
regard for international treaties, interference to other existing
services, and the availability of other services that already serve the
requirements.

What's the difference between an "open 11 meter DX hobby band", and HF
ham radio, other than the license requirement? The FCC surely doesn't
see the difference, and it would be difficult trying to make a case for
it.

Anyone that's really interested in DX should have no problem getting a
ham license. And there is nothing that says that once you become a ham,
that you have to give up CB and the friends that you have there (I

didn't).

Nothing, really worthwhile in life, is free. You have to put forth some effort, in order to reap the benefits. If people are not willing to work for a ham license, then they aren't serious enough. Trying to change the rules to what amounts to "welfare licensing", simply to accomodate the lazy, and unmotivated, diminishes the value of whatever it is you're now giving away.

> coverage to freeband??

There are currently no Radio Shack radios that have PLL chips that can
be easily modified for out of band operation. Some may work with more
extensive mods, but IMHO they're not worth the trouble.

As far as price, unless you catch a closeout sale, RS has no price
advantage. I would recommend finding a mail-order stre that carried a
Uniden Grant XL. This radio can still be modified via the PLL for
out-of-band operation, and they're usually available in the $129 range.

Thanks to Tim,John Sean Tnom.
The radio meter swings forward
the mfj peak and avg swing forward
I have a pdc 6oolp when i put it in line it swings forward. I can control the input to the amp 3 to 10 watts ,when i drive with low watts the amp has high swr and i think it tries to self osoolate- when i drive with 10 wats it has low swr 1.5 and is loud and clear. Ithink the amp input is 1 to 15
I get good reports from skip land, mod squd in hawaii says the meter on his radio swings forward when i key . SWr on maco 5 beem is 1.5 , 1.6 on a99.
The field strength meter is on my work bench by the window with ant wier hooked to alumm window fraim.
I am not to concerned because i can talk real good!!!!!!!!!
IT's just one of those things that FUCk with my little brain!!!!!!

The reason allot of people go C.B. instead of HAMters(just a joke) is because of the freedom that it provides without having to go through the technical mumbo jumbo. People want to hook up a radio and shoot the shit and not have to learn code and study technical practical applications and so forth. They want to key up a station, say what they want when they want without the limitations and restraints that Ham licensing requires. They want to be called "MC Hammer, Mr Gunn, Nut Cracker,The Prophet" not assigned call letters like WKRP and alike. Not that this is wrong.

Right or wrong that's what the people want, that's why they call it "Citizen Band" because the majority rules and the majority are the people who want to do what they want to do. Thats why C.B. will always be there, cussing & fighting,playing musical carriers, running big watts. Its not going to change, they can bust a few people, crack down on it a little at the tax payers expense, but under the surface there will always be hard-core DXers and pirates not willing to give up the hobby.

just my opinion,
KRS

instead of going through all of this trouble why not just simplify things by buying a quality radio tuned for optimum performance..(depending on radio and preference) with a power mic (if needed) and if you insist, get some extra juice (an amp)....why go through all this "nickle and dime" bullshit to be satisfied with your equipments performance?Dont think your going to start talking any further after you install one of these over-priced and over-rated "swing" kits....your alot better off doing what i mentioned above if you want to really be herd.

Actually like I said some where the Square root of 2 is the right number to use!

"Joe 2NC605" <2nc605@usa.net> wrote in message news:83r3dnuiq1@nnrp1.deja.com...
| The formulas you attempt to give are for volts and do not apply
| driectly to watts.
|
| I think you meant to say
|
| Peak is RMS / 0.707
| Peak is RMS * 1.414
|
| or
|
| RMS is Peak * 0.707
| RMS is also Peak / 1.414
|
| Dont forget this is the conversion formula for voltage and thus the
| current. Wattage is found by multipling both.
|
| 0.707 * 0.707 = 0.5 RMS power is 1/2 of Peak
| 1.414 * 1.414 = 2 Peak Power is twice RMS
|
| This is only true for sine waves.

Thanks Bill, been saying this all along, it is just that they believe
what they want to believe, if the meters are wildly swinging, then it
must be putting out a "big signal."

> there.

All this does is hold the carrier down at a low level and then it is
increased with modulation. At 100% modulation you still have 50% of the
power in the carrier and 50% divided between the two sidebands. It
causes output and s-meters to swing with modulation, that is all. The
signal is no louder by modulating a 10 watt carrier up to 100 watts than
simply modulating the 100 watts of steady carrier with high level
modulation.

I dont understand why so many Cbers on this post have so much hatred toward HAMs. I personally know of several hams in my area that are former or are still active CBers and they are great guys to talk to!! Sure you have your assholes that act like FCC wanabees and you have your ham geeks that run around with antennas on their coke bottle glasses that act like know it alls but all in all they are good guys!! I myself am just your average Cber and dont have any intentions of joining the ranks of hams. I dont run competiion, ghetto type linears or fancy $1000.00 radios or, worry about being a mudduck or, any of that stupid crap some guys worry about. If I cant hear you.. oh well.... I f you cant hear me.. oh well.....i just get on the radio and have fun talking to the locals and shooting a little skip now and then.

<< Right or wrong that's what the people want, that's why they call it "Citizen Band" because the majority rules and the majority are the people who want to do what they want to do.>>

A word about "majority rules". The framework of the law is how we define and protect justice. If everyone were to subjectively define justice, order and law would cease, and there would be no justice. There would be only anarchy.

However, many would agree that with regards to radio, there must exist some small license-free portion of the spectrum set aside where "anything goes" and people are left to decide for themselves if they will be at their best or worst behavior. A form of limited anarchy.

Instantaneous values of velocity only apply to a given point in time.
Moving from point A to point B then returning to point A would be
considered a cycle. Thus, the amount of time or speed to complete a
cycle would be an average value.
10 ft. - 0 ft. / 10 sec. - 0 sec. = 1 ft./sec.
Any numerical value divided by itself is equal to one.

ASBESTOS SHORTS ON: FLAME ON
Ernie:
Mark Twain once said, "Better to keep quiet and thought a fool, than to open your mouth and remove all doubt!" The FCC is still operation, the Columbia, MD office is still there, it is remote control at 9200 Farm House Lane with remote sites operated by FCC, NSC and the like. True, budget has been cut and offices closed but agents are still in the field, they are called resident agents in some places, operating out of their homes. Congress this year (Fiscal) increased budget slightly, but it has gotten held up in the legislative process. The Enforcement Bureau has been reorganized and is slated to be increased, with several different departments added. (see www.fcc.gov/bureaus). Ben and Qrm2000 are on the track, just listen and learn. True, not much emphasis put on CB and with Riley Hollingsworth doing easy picking enforcement, it seems that things might pretty easy but remember, the FCC is still

able (legally) to carry out communication enforcement. Us HAMbros understand this and don't need a hassle with the man becuase he will win if push comes to shove(He got de man on his side as well as the US MARSHALLS with de GLOCK 9MM). Seperate the wheat from the chaff (BS), read sign and learn.

|> Usually in a "swing kit" the collector of the final receives a burst
of
|> positive voltage, which is in phase with the positive modulation swing.
|> This added DC voltage causes the final to amplify to a greater extent and
|> increase transmitter output power in step with the positive peak
modulation.
|
|Actually what happens in most "high level" radios (like the Cobra 25/29)
|with "swing kits" is that the driver's DC collector current is limited
|by a resistor, which lowers the carrier power. The resistor has a
|capacitor in parallel to it. This capacitor allows the AC component (AKA
|the modulation) to bypass the resistor, and allow the full modulation
|swing.
|The total modulation swing (peak power) is no higher than it was before
|the swing kit was added, but now since the carrier is lower, the RATIO

|between carrier and modulation has increased, and the modulation
|amplitude is greater, which DOES increase your loudness. No arguement
|there.
|
|>
|> As far as interference, etc, etc.... I suppose if someone disables
their
|> limiter then, they might as well make use of the swing kit.... which is
|> beneficial..... does it give the appearance that they are louder? I say
|> yes.... if yes is the answer, then its safe to say it has a benefit....
this
|> debate/argument is NOT over the fact of how good the benefit is or is not
|>
|
|That's why I tried to define the term "benefit" before. If your goal is
|pure loudness, at the expense of clarity, RFI, splatter etc. then yes,
|it has a benefit. IMHO though, that is not a benefit, since the
|downsides far outweigh the advantages.
|
|Dave
|"Sandbagger"
|
|

Dave,

I should have clarified myself.... I did NOT see what you were trying to do.... In fact I was trying to get my daily reading in within a certain time frame.... <g> Most of my customers dont care about whether or not they cause TVI or splatter other channels.... Try talking a customer out of a "swing kit"... they will only go elsewhere.... So... at least to them, and my pockets, it is beneficial.....

Jeff

JJ,

Tell you what... Have a buddy go about 1 mile away and listen in on a designated channel....

Then get a stock Cobra 25 LTD (with exception of a cut limiting diode) and one with a swing kit.

Now, with EVERYTHING the same on these radios with the exception of the "swing kit".... Have your friend tell you that it DOESNT sound louder on his end... or have HIM talk on the radios, and you tell me its not louder.... I will call you a liar... because since this thread has GROWN, and I mean grown, I decided to do it myself..... It makes you sound louder... period... Quality is more less in the eye of the beholder.... sooo... But, as far as Cleanliness, I would have went with the 25 LTD STOCK!..... but, you rarely need clarity when someone is busting your speaker out because they are so loud.....

|
|All this does is hold the carrier down at a low level and then it is
|increased with modulation. At 100% modulation you still have 50% of the
|power in the carrier and 50% divided between the two sidebands. It
|causes output and s-meters to swing with modulation, that is all. The
|signal is no louder by modulating a 10 watt carrier up to 100 watts than
|simply modulating the 100 watts of steady carrier with high level
|modulation.

It seems to me that Dave Made is more or less the standard to go by as far as 11 meter amps are concerned.Ive tried most of the mass boxes out of which I prefer Texas Star.Ive also tried Pirate,Skullcracka and Cookie.For the last year Ive been running Primes boxes with what I consider excellent results.Pirate did well for me also.I never did have a problem with swr what so ever!Cookie,well.....
Anyways I bought the M400 and installed it in my vehicle in place of my 4 pill skull.I left all equipment the same for both tests after checking input and output swrs which by the way were great for both boxes.I am not running a volted system.For both boxes in holding 14 volts.Here are the results!
Skull
rms=275 watts
peak=700

Dave made
rms=350
peak=800

All readings are with a bird 43p.
Now this test means absolutely nothing but all else being equal the dave made did do more watts!

Sorry Bill I would call that to high a deadkey.
Power supply shouldnt be any problem because if you got it to do 800 watts deadkey then the supply is strong enough to get it to swing 800 watts forward from a lower deadkey

No. The country sucks for many other reasons. If I had said E-bay sucks it would have been for the above reason, But I didn't say E-bay sucked.
I said this country sucks in this area because we have become such a lawsuit happy, nail whoever has the money to pay oriented that E-bay has to worry about it.
They shouln't have to worry about something so petty.
The amp itself isn't the issue. Its use is.
And if anyone thinks " Well it makes it harder for people to get and get rid of the amps.." There are plenty of other ways than the all to mighty E-bay to get good money for an amp.
Just a bunch of petty bullshit to me.
When all the drugs, all the crime, all the poverty, all the disease, is gone in this country and we have fixed eveything else.....hey let's clean up all that high power interference from those damn CBers.
REALLY. The whole system sickens me.

not always the case.i run a northstar 990 and when in the mobile i would run
the d104 unamplified noise-cancelling mike and it was loud and proud with
the wonderful little background noise...
quiet.
makes a big difference when you have no background noise to rough up your
audio.
tune the radio to accept the mod and do good work with it instead of
cramming modulation down it's throat and making it choke.
i started out as a mod limiter ripper but i have learned the error in my
ways.

>But I suspect that you
>would not be pleased with the audio level from the unamplified mike, on

3083. Re: Best CB/AM/FM Antenna?

Newsgroup: rec.radio.cb
Date: 1999-12-22 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <83qmfc$ng2$1@fir.prod.itd.earthlink.net>
Source record: 16532

Well, there's lots to choose from, but if you want a 'combined' antenna, then the first qualification is "WHY?"

If you want it for 'stealth' reasons, then it HAS to look like a genuine AM/FM antenna. This will seriously compromise any performance outside of the FM band. These kinds of antennas charge a premium, but are available EXACTLY right down to the mounting hardware that shows to match the original equipment manufacturer of the vehicle.

Or you can save some money by buying a 'generic' but still stealthy antenna that is pretty much indistinguishable from a generic aftermarket AM/FM antenna.

If you want it 'mildly stealthy', then you might get slightly better performance, or even much better performance. RS used to sell one of these. It didn't look like a generic AM/FM antenna, it had a coil in the antenna, and it only worked 'ok', but it installed as a replacement antenna for the AM/FM antenna. I haven't seen this since about 1981 or so. There are also 'retractable' antennas that fit this description.

Mike

3084. SOme questions, help me

Newsgroup: rec.radio.cb

Does anyone know how to hook the cb up to the computer?
I found a piece of software design for controlling the cb through the
compute, but can't get a hold of the guy who wrote it. Can anyone help...

Also has anyone found any mods for Cobra 18xtst, yet?

Jason Hopkins

This one is somewhat fuzzy. It is also said it was named after the character "Jeep" in the Popeye cartoons because Popeye was very popular when they named it, and also because it could go anywhere like the character "Jeep".

Of which voice is not a perfect sine wave..... I suppose everyone is using
a signal generator will conducting these tests....

Joe 2NC605 <2nc605@usa.net> wrote in message
<83r3dnuiq1@nnrp1.deja.com>...
|The formulas you attempt to give are for volts and do not apply
|driectly to watts.
|
|I think you meant to say
|
|Peak is RMS / 0.707
|Peak is RMS * 1.414
|
|or
|
|RMS is Peak * 0.707
|RMS is also Peak / 1.414
|
|Dont forget this is the conversion formula for voltage and thus the
|current. Wattage is found by multipling both.
|
|0.707 * 0.707 = 0.5 RMS power is 1/2 of Peak
|1.414 * 1.414 = 2 Peak Power is twice RMS
|
|This is only true for sine waves.
|

I wouldn't need any software on it, you could keep it and even
fdisk it first and send it blank. (Don't do it yet!) I would
load 95B on it and WinAMP, and fill the rest up with my collection
of mp3's. It would be better then a pile of CD's and would have a
hugh capacity of music. F*ck the Rio. It can't hold enough. 2 hours.

If you are talking about a pure sine wave (carrier) then you are
incorrect. Peak equals RMS or average power.

If you are talking about 100% sine wave modulation then the
Peak power is four times the RMS or average power.

You need to go back to the books. Or maybe get some more.

In an earlier post you stated that:

>Peak is RMS * .707 or about 70% more then the RMS.
>RMS is peak / .707 or about 70% of the Peak
>What do you need a meter for?

If you would go back to the books you would see that
the RMS wattage of a sine wave equals the Peak wattage
of that same sine wave.

There is no difference between them with a carrier signal.

3100. WTB: Antenna Bracket

Newsgroup: rec.radio.cb
Date: 1999-12-22 00:00:00 UTC

snip

>Not quite. With 100 watts peak modulated signal, you have approximately
>50 watts of carrier and 25 watts in each sideband. Only one of the sidebands
>is used on receive - so there is 25 watts of useful signal.

If you are talking about a politically correct 100% sine wave
modulated AM signal then a 100 watt peak wattage signal
will contain a 25 watt carrier and two sidebands of 6.25 watts
each.

A. the signal starts with a 25 watt carrier
B. it increases to 37.5 watts with modulation
C. and measures 100 peak watts

3102. Mobile Unit vs Handheld - Which to Buy

Newsgroup: rec.radio.cb
Date: 1999-12-22 00:00:00 UTC
From: ray_stark@mindspring.com
Message-ID: <83s4m0$27o$1@nntp6.atl.mindspring.net>
Source record: 16551

I have a F250 Diesel truck and 33' 5th wheel and will be traveling across country for 3-4 months then up to Alaska. Got the cell phone and thought I should probably also get a CB.
Questions: What's the quality like for the handhelds with the short antennas? I do not want to extend a 5 foot antenna in the truck so I was thinking about a Cobra or Midland with the short (3") antenna. If I go mobile, it takes up room, a lot of wires, I've got to wire it up, get an antenna for the roof, etc. I'm a little concerned that my 12.5 foot high 5th wheel will block a lot of the signal either way.

Second question - is it worth getting a CB with the NOAA capability? I've seen units that receive from 3-10 NOAA stations. Are these worth the extra $30 bucks?

Last question - I can't seem to find any product evaluation (handhelds vs mobile) on the web. Any suggestions?? Thanks!!!! from Ray S

Thanks to all of the [unanimously negative!] responses to my query
about the best CB/AM/FM antenna/splitter. What triggered my question
was that one of my Hotbot searches had turned up this comment on the
Miata Mailing List:
" I finally purchased a CB Radio for my Miata and had
a chance this past week to give the CB antenna
splitter I purchased from Jeff Anderson a try. It
is truly amazing! It seems to work every bit as good
as the K-40 antenna I have installed on my 18 wheeler!"
So are you guys saying the author of this article is all wet or this
is a fluke peculiar to this splitter optimized for the Miata or. . . ?
I admit I'm disappointed - but forewarned is forarmed. Thanks alot
for your input!

Pat

I'd say the list was pretty unanimous that the device will work, but
NOTHING like a K40! Ok, maybe like a defective K40 with a broken
wire in the loading coil.

Otherwise I'd say the author of that article is full of ....

Mike

Source record: 16560

If I take Firestick's approach as descrbed below do you think I would get performance comparable to that of the CB antenna selected - or is this write-up in the same realm as the one on the Miata mailing list??

Firestick's FAQ says start with a good CB antenna and pick-up a tunable 3-way splitter (like our AR-1A). Then ". . . tune the CB antenna without the splitter in line to establish a set of reference points. Next, put the splitter in-line (connected to the CB, the AM/FM radio and the antenna) and recheck the SWR. Make any fine adjustments for the CB antenna with the appropriate adjusting device on the splitter. And finally, tune in a local AM broadcast station in your area and tweak the AM adjustment on the splitter. . . ."

Thanks for your help.

Pat

You should feel blessed that you are able to express yourself in such a manner.
Albiet, not very wise, nor is it very appriciative. Others would be happy to
be allowed the freedom to make such expressions. Thats why you are still here.
You wouldn't survive under the harsh ways of other governments.

Now to use the Lords name in vain. MMMM Well far be it from me to let you in on a little secret. Oh. I will just keep it to myself since your so smart you probably already know the answer.
I wouldn't do it. I can't stand the heat.

God Bless you all
Have a Very Merry Christmas

Lets assume your swinging radio is swinging to 100 watts on peaks, then
take a radio that is putting out a 50 watt carrier and modulated using
high-level modulation and it will be every bit as loud as your swinging
radio.

Yeah. Like this guy. He got a couple of chances and still blew it. And yes, he got to meet the FCC face-to-face:

FLORIDA MAN FINED $20,000

The FCC has levied a $20,000 fine on a Florida man for violations stemming from alleged unlicensed operation on Amateur Radio Frequencies. William Flippo of Jupiter is accused of willful operation of an unlicensed radio station on 28.375 MHz, willful and malicious interference with ongoing Amateur Radio communications, and with failing to let FCC representatives inspect his radio equipment. All of the alleged violations are said to have occured Jun 8, 1999.

According to the FCC, a CB operator known as "Rabbit Ears, was the source of intentional interference to ham communications. Last February, the FCC Tampa Field Office advised Flippo of the allegations and warned him that a fine could result.

When renewed complaints from hams arose this spring, an FCC agent traveled to Jupiter to investigate. The agent used direction-finding techniques to determine that intentional interference to amateur traffic "was occurring and that the intentional interference was being transmitted from the residence of William Flippo.

The FCC agent, accompanied by a local sheriff's deputy, attempted to inspect the radio equipment at Flippo's residence on June 8, but Flippo reportedly refused to allow the inspection.

Flippo had 30 days to respond to the FCC Notice, sent July 12 by FCC Tampa District Dirctor Ralph M. Barlow.

-------From QST, September 1999, Page 69

[Note: So much for the theory that the FCC never leaves home!]

If this is the VSWR going into the box I'm not too surprised. Every multiple power amplifier I've seen uses a switched attenuator on the input. This always changes the input VSWR as you switch modes. If the input attenuator has some burnt resistors, that might explain your wild readings. If you are talking about the output, the it could be your dummy load, coax or antenna. Try to rule them out one at a time.

MC

He should build an efficient amplifier with modern engineering and components...not this thing. Sure, 64 transistors sounds impressive, but you can do the same thing with only 4 MOSFETS and it will fit under the seat in a pickup truck and draw about 30% less current.

Ahhhh, you gotta love the old Chevy vs. Ford arguement. It's like this. In junior high school, Bobby (the Chevy) beats up Billy (the Ford). Next week, Billy beats up Bobby. Then Bobby beats up Billy again then next week Billy beats up Bobby. This continues for months and the whole schooll thinks these two are the "baddest". Suddenly, Tommy (a Porsche, a Viper, an ols AMC AMX or even a Testarossa) comes along and whoops both of their asses! The bottom line is: Chevy and Ford AREN'T the only cars that are powerful, in fact, they produce some of the slowest production cars in the world- just go to the REAL racetracks, not a dragstrip. Dragstrips are nothing but modified cars.Go to a roadcourse and watch the stock production cars in a dogfight. It may surprise you.

I just bought my first CB radio today. It's a used Cobra 25GTL. The guy at the store said it was running about 30 watts. Anyways, I've been messing around with it, but really don't know much about it. How can I adjust it properly? I am taking it back to the store tomorrow now that I have it all hooked up and the guy is going to a SWR meter to adjust the antenna. Will this make a big difference in the performance? What are the RF Gain and the Dynamike knobs for? How can I adjust them properly? I also bought a PA horn for it, but it doesn't seem very loud even with the volume turned all the way up. Is it possible to boost the volume a little bit? If anybody has any info, I'd appreciate it! Thanks!

I am looking for a radio for my car that doesn't take up much room. I have a 1992 Pontiac Bonneville SSE and it has a center console in the car. There is absolutely no place to mount a radio in here unless I want my leg jammed into it all the time. I saw the Cobra 75WX XT remote mount radio. Is this a good radio? Does it have a CB/PA switch or does anybody know of one similar to it that does? This is about the only thing that will fit in my car without being an eyesore. Thanks for any info!

From: Chris <chris@moonco.com>
Message-ID: <38619D47.CA615911@moonco.com>
Source record: 16600

RF gain is like the "recieve volume". i leave mine all the way up, and dynamike is the intensity of the mic. If you are using a power mic dont turn the dynamike all the way up or it will squeal. If you are using a stock mic then you can turn it all the way up.. Makes you sound louder. (sort of) Yes, tuning the antenna will give you better transmit performance. Make sure that you have a SWR of 1.5:1 or lower. If you turn the dynamike up with the PA horn then it will be louder. Becareful with feedback. Email me with any more questions.

3153. Re: Mobile Unit vs Handheld - Which to Buy

Newsgroup: rec.radio.cb
Date: 1999-12-23 00:00:00 UTC
From: Chris <chris@moonco.com>
Message-ID: <38619F2B.232083D6@moonco.com>
Source record: 16602

A little handheld will not do you much good (range wise). A 3" antenna will probably not talk across the street. I would go with a mobile unit with a cigarette lighter plug on the end of it. Go to radio shack and buy a mag mount whip antenna. The longer the better. You can talk a lot better with a mobile than with a handheld. Batteries cost a lot too!!. (if you know what I mean) The trailer will not block out much signal. You will still be transmitting signal in the direction you are pointing. A weather capable radio is not really necessary unless you have a good antenna that is for the 2m band. In my opinion it is not really worth the extra money. If you buy a mobile I would go with a Cobra 25 or 29 LTD. They are good radios right out of the box and can be modified very easily.

Email me with any questions.

Chris

This is what this country is all about!!!
Or was at one time and would still be if the majority of idiot citizens didn't let it get messed up so.

>Others would be happy to
>be allowed the freedom to make such expressions!!!

Sure, they may. They are not here though. They don't live in a country that was founded to escape many wrongs that were going on. This was supposed to be a better place because it was created that way(legally that is).
It was a better place and it has been better than it is now....Downhill slide...

>since your so smart you
>probably already know the answer.
>

If I detect sarcasm, please note I never said I was any smarter than the next guy.
I was merely stating an opinion. YOu know those things everyone has.

>Now to use the Lords name in vain. MMMM

Now that was my bad. Sorry to offend anyone. I used it out of disgust and for emphasis as opposed to against religious nature.

I heard al of my life growing up how "This is the best country there is to live in and how lucky we all are"
The American citizens have sat on their collective asses believing this and let this country go into the toilet. In many ways of course. I am mainly speaking here of personal freedom and rights of each and every person in existance on this soil.

3171. Something to think about when looking at "numbers".....

Newsgroup: rec.radio.cb
Date: 1999-12-23 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <wnk84.3$M56.255@news.corecomm.net>
Source record: 16620

There can be a DRASTIC difference in output levels when comparing boxes due to ONE very important factor : Impedance.

Since NO box is exactly 50 ohms on the output, changing the impedance that the box sees can make some pretty sizable changes in power output. I have witnessed increases by several hundred watts just by changing antennas (all else being equal). This is because THAT specific antenna on THAT specific vehicle presented the optimum load impedance to the amp and was achieving optimum power transfer. Whether or not the antenna is the most efficient radiator is another story.

A local guy here has been playing with 4 different antenna systems on his suburban. Using an 8 pill on a 14.5 volt system, he was seeing 1300 peak on one antenna (Nugatron LX 1000), 1400 on another (Designated Drivers "Millennium Stick"), 1600 on the third (long shaft 55 made) and 1900 on a two element beam array (home made copper fighting sticks). All of these are with very similar numbers on reflected power, so that does not come into play.

I also witnessed this on my barefoot mobile when playing around one day. With three different antennas all set to show a flat match, they proceeded to load up 7 watts into the first antenna (D.G. Copper), 8 watts into the next (Signal Engineering "Golden Rod") and 10 watts into the third one Stargun 20K Bopper). Even though they were all tuned very well, they obviously loaded up differently.

Please don't take these figures as saying that one antenna is FAR superior to the other (although you all know which one i like). Both loading ability and radiation patterns will vary depending on vehicles and mounting locations. The only way to see what works best on your specific installation is through trial and error. Sean

Thanks tnom,

I am just referring to the formulas given in this thread for wattage.
Peak to rms conversions for sine wave voltage/current were used
directly for wattage and that does not work.

The constant in the conversion (1.414) applies to true sine waves not
modulated RF carrier.

In article <3IxhOMOwkagrhWHqXgCJBt98vXU2@4ax.com>,

Like the subject heading says, I have a General Radio 10 Amp variac that needs a new home.

For a pic and info;

http://members.aol.com/Reactor001

$50 plus shipping (trades considered...whaddya got?).

Interested? Please respond by email.

Regards,
Tom Mitchell

There isn't a main bracket for mounting that antenna if it is a true Avanti Sigma 5/8. There is just an aluminum 2 inch pipe that sticks down and you use U bolts to clamp it to a mast. Like the way an A99 fastens to the mast. If you mean the 2 aluminum plates that hold all 4 bottom radials onto the antenna, that is the same hub that the Moonraker uses on each of it's set of elements.

Ray, your numbers are pretty reasonable. At about 14 to 14.5 volts, i typically see about 400 - 425 rms out of the M400 (gee, kind of a coincidence on power output and model number, huh ??) and a modified Texas 4 pill. Of course, this does require adequate drive for both of the boxes to operate properly and is being measured into a dummy load. Readings taken on a well calibrated antenna should be similar.

Those numbers are what the box can do without "backswing". Keep in mind that different radios produce various waveforms and can play games with the average power readings as taken on a Bird type wattmeter. Peak readings on the Bird are more accurate, regardless of the type of radio being used.
Sean

It seems to me that Dave Made is more or less the standard to go by as far as
11 meter amps are concerned.Ive tried most of the mass boxes out of which I prefer Texas Star.Ive also tried Pirate,Skullcracka and Cookie.For the last year Ive been running Primes boxes with what I consider excellent results.Pirate did well for me also.I never did have a problem with swr what so
ever!Cookie,well.....
Anyways I bought the M400 and installed it in my vehicle in place of my 4 pill
skull.I left all equipment the same for both tests after checking input and output swrs which by the way were great for both boxes.I am not running a volted system.For both boxes in holding 14 volts.Here are the results!
Skull
rms=275 watts
peak=700

Dave made
rms=350
peak=800

All readings are with a bird 43p.
Now this test means absolutely nothing but all else being equal the dave made
did do more watts!

Peak to carrier ratios can be WAY higher than 4 to 1. That is only the measurement when you are reproducing sine waves and not complex voice patterns. Sean

You've sparked up (at least) one too many.

The only production 148's that are being made now are the 148 ST's soundtrackers). The 148 GTL F's have been out of production for quite some time. I would advise against purchasing the 148 ST due to the lowering of parts quality and performance that i have noticed with these versions. Look for either the Uniden Grant XL or the Texas Ranger TR-296 if your stuck on the 148 style chassis.

The Uniden uses a newer board that takes advantage of Computer Aided Design in it's layout but also has a change to the way that the AM regulator is mounted. In my opinion, it is much poorer and tends to fail relatively quickly. They should have stuck with the original way to mount it.

The TR-296 is an exact clone of the last production runs of 148's that Ranger built for Cobra. This is the closest that you will come to the 148 GTL in a radio that is still in production. Sean

3183. What is this antenna??

Newsgroup: rec.radio.cb
Date: 1999-12-23 00:00:00 UTC
From: Dwight Stewart <stewart@amouse.net>
Message-ID: <3861EAB9.1583D368@amouse.net>
Source record: 16632

My landlady just gave me a bunch of CB radio equipment that was used by her husband before he passed away. Included is a antenna that I vaguely remember being advertised many years ago, but I cannot remember anything about it.

This all aluminum antenna has two slightly curved 17 foot vertical rods that attach to a large 3-foot metal ring at the bottom and a hat with four 2-foot radials at the top. The vertical rods, ring, and radials, all seem to be about 1/4 inch aluminum tubing.

Anyway, the antenna appears to be in complete condition, but needs some cleaning to get off a layer of corrosion. I was wondering if the effort is worth it, or should I just cut up the antenna and trash it.

Anybody remember this thing?

I did some common "radio checks" on my mobile using those same antennas that
i listed. I used 3 different base stations as references, all at a distance
of about 15 to 20 miles away. None of them knew which antenna was which and
i actually ran one antenna twice without them knowing it (control factor).
I simply said " this is antenna A, etc... all the way to antenna D.

The results matched the "loading" of the antennas. The DG was the lowest
with the Signal Engineering "Golden Coat-Hanger" coming in second and the
Stargun Bopper easily beating them both.

Nothing scientific about it, but all three stations came up wth the same
results. The problem with near field readings is that they don't take into
account radiation angle, which is extremely important. I was actually
pretty surprised that the S/E antenna did that well, as it has a high
percentage of horizontal radiation. Sean

This would be an Avanti AstroPlane. I owned one many years ago. It is definitely a keeper.....low noise, low SWR, good ears.....on second thought if you want to get rid of it.....I can give you my mailing address <G>

snip

You are wrong here. The definition of peak power is the RMS power
measured at the peak of the modulation envelope.Not the instantaneous
power measured at the peak of the RF sine wave. Since there is no
modulation envelope in a carrier then there is no to increase in the
measurement. They are the same.

>somewhere else. You don't scare anyone
>here. Lost licenses? Confiscated Gear?
>OH REALLY? Please state the call letters
>and names of the hams you are talking about!
>AND the source of your information.

Gladly.

The FCC levied a $7500 fine on a New Jersey ham who allegedly interfered with a net operation on 40 Meter SSB. James C. Thompson, KA2YBP, of Waretown, also was ordred off 40 meters until further notice after the October 18 incident.
The FCC charged Thompson, 58, with illegally retransmitting programs from a Standard Broadcast (AM) station and willingly interfering with the net. The FCC also said Thompson failed to properly identify.
FCC personnel used a combination of long-range and local monitoring and tracking to zero in on Thompson's QTH [location] as the source of the interfering signl, then conducted an inspection of Thompson's station. FCC officials found an AM receiver "positioned adjacent to the Amateur station's microphone and tuned to 1450 KHz," the FCC said.

The FCC has beefed up enforcement on other fronts as well. In early November, the FCC named two hams among the operators of four unauthorized HF broadcasting operations. One was in Massachusetts. Another was in Illinois. The others were in Texas and California. Two were unlicensed individuals, whose names had been withheld at press time. The Amateurs were 41-year old Richard F. Jurrens, KC5RGK, a Technician licensee who lives in Katy, Texas, and 46-year old Henry Lee Landsberg, WB6MEU, an Advanced class licensee who lives in Sierra Madre, California. Their Amateur licenses were "in jeopardy," an FCC official said.
The busts, coordinated out of the FCC's Columbia, Maryland, Operations Center, involved on-site visits by FCC agents from the Boston, Chicago, Houston, and Los Angeles offices.

Also in November, the FCC and the FBI announced the arrest of a Georga man for allegedly interfering with radio communication between aircraft and air traffic controllers in Northern Georgia. Kevin M. Kelly, 46, was arrested without incident at his Cumming, Georgia, home by FBI agents accompanied by FAA and FCC agents. The arrest followed a search of Kelly's residence. The FBI described Kelly, N2BYE, who holds an Advanced class license, as "a highly experienced electronics engineer" who was said to have been "extremely upset" about air traffic noise above his home.

-----Source: QST Magazine

There are a lot more of these piled up on the desk. As time permits, perhaps I can type up some now and then. (Unfortunately, I also have to earn a living!)

Here's the summary:
(1) The FCC is active.
(2) The Columbia MD Operations Center has NOT been shut down (as reported in Rec.CB).
(3) The FCC still makes house calls.
(4) NG mis-information concerning radio enforcement comes from one of these sources:
(a) "I think....."; i.e., folks who don't read FCC websites or radio magazines.
(b) Folks (like Ernie's CB Shop) who make a living selling illegal equipment. They have to repeat the "no enforcement" line at every opportunity or their sales will dry up.
(c) And the REAL slime-buckets; those who KNOW there is enforcement, but who get a perverse pleasure out of leading unsuspecting lay people down the wrong path.

Fortunately, people are beginning to challenge what they read on the Internet. They want to know who is writing an article, and what that individual's agenda is. People now demand specifics--names, locations, etc.--rather than "I heard this at work" or "They say....." I support this call for accuracy, and whenever I contribute something, I am prepared to produce my sources and to name names.

I urge others to do likewise. Let's keep the NG a place to get GOOD information--not rumors or BS about how you "wish" things were.

No I wasn't being sarcastic. I was just expressing my concern about using the lords name in vain. Its about the only thing I will just be out right with and correct. Otherwise we are all able to express ourselves.

You have redeemed your self. And I certainly understand your views. But we do,. have it a lot better than most.

I just wanted to point that out. I don't know how old you are or if you have been in the military or served in a public service job. But I am old, have served in both the military and public service and seen that we do live in a great county.

I mean look at Bill Clinton. See how lucky he is to live in this country????

:)

Happy Holidays Anyways. OK.

God Bless you.

Gee, let's look at this post a little closer... Seeing as how you don't have a clue as to what your talking about.

> if you are so smart in electronics, which you are, why are you working with lowlife maggot cbers??

>>>>I don't. I work in the computer networking area. I owned a CB shop in Mesa Arizona in the early 90s. I now do very little CB work.

> why are you not making real money working for a real company???

Umm..... Their is one person on this newsgroup that can attain to my rates.

However, on a calorimeter type wattmeter, you would want to see the output
go up 50 percent on a 100 percent modulated carrier..
IE carrier 400 watts
RMS 100 percent audio 600 watts.

Some of the more expensive Birds will show the same thing, and even the 43
with a pure 100 percent negative and positive modulated radio will show
SLIGHT positive carrier shift.

CB was deregulated in 1983 when the FCC stopped issuing licenses for 11 meters and gave up on enforcement of the band. That's why the Citizen's Band is now filled with splatter box amps, noise toys, and foul mouthed, rude, discourteous radio operators.

I wonder if X force can mold a dildo from Daves dick?

"DriveByShooter" wrote in message news:wRd84.20$M3.1335@news2.voicenet.com...
Wouldnt you know X-Force had there copy machine out again, and took another page from the master again. Dave has been making these antenna mounts for more than 10 years just look around and ask the guys who have them. And now x force has copyed him again with the antenna mounts check them both out you tell me they are not obsessed with davemade . The worst part about it is the price differance. x force mounts sell for $89.99 on sale, where as the davemade sells for only $40.00 everyday price from the guy who actually designed the mounts you pay more than 2x that with the imitation. the pictures are as follows One mount is the davemade the other is the xerox . Happy Holidays

That is an Astro Plane antenna for 11 meters.
It was designed back when they had the 20 feet above any structure
antenna rule. If you had a ground plane that was 22 feet tall, your
ground radails would have to be 2 feet below your roofline. SO, they
made this antenna to get more antenna radiating area up as high as
possible without beeing over 20 feet above your house..

There's a old saying: There's no such thing as a free lunch, and it
applies in this case as well.

Your test scenario is all well and good, and I agree with the results
that you will see. Now, repeat the test at about 8 or 10 miles out, and
see what happens. While your peak modulation power will be the same, the
carrier power with the swing kit will be less, resulting in a weaker
signal level than the radio with the full 4 watts. During periods of
"lesser" modulation, your signal, with the swing kit, will be subject to
interference from other stations with slightly stronger carrier levels.

While is is true that your modulation is what carries the intelligence
in your transmission, the carrier is what quiets the receiver, and
blocks out background noise.

I've listened to "swingers" in the distance, and they are usually much
harder to copy than someone with minimal or no swing. The rapid changes
in signal cause the receiver's AGC to have fits trying to keep up with
the wildly changing signal levels. Many of these people also, for
whatever reason, get distorted by the noise blanker of the receiver (I
have to turn it off to understand them clearly). I don't know if this is
a result of excesive swing itself, or distortion products that are
introduced as a byproduct of the negative cutoff, or just a badly tuned
amplifier.

> measurement when you are reproducing sine waves and not complex voice
> patterns. Sean
> >

You realistically (not radio shack!) cannot have more than a 4:1 peak:carrier ratio, without driving the negative peak to clipping and distortion, using standard modulation techniques. You can artificially simulate a higher ratio with a controlled carrier or through asymetrical modulation techniques. A controlled carrier gives the appearance of a higher peak/carrier ratio because the carrier is shifted along with the modulation. You might start out with a 2 watt dead key, and modulate to a 16 watt peak (Which looks like an 8:1 ratio), but what's really happening is that the carrier is boosted during modulation to the 4 watt level, which springboards the modulation to 16 watts, while the ratio remains at only 4:1. The nice thing is that the negative modulation is also not clipping as it is also at 4:1.

Asymmetrical modulation techniques are a little harder to implement. You, in effect, need to "offset" the normally symmetrical modulation(equal positive and negative) so to keep the negative at 0 power, and allowing the positive peak to rise to higher ratios. Making this work would seem to imply DC coupling, since AC coupling usually balances positive and negative equally. I have not seen a good implementation of this technique in a CB radio yet. I would be interested in checking one out if someone does manage it.

> I'm a Ham operator and I'm interested in knowing what a "ghetto" type
> linear is, and who you think uses them

Well, if you take the context of the term "ghetto" to describe a
low-rent area, that's typically in disrepair, and lacking in many
luxuries, and then apply it to an amplifier, you get:

A dirty, poorly designed amplifier that can be had fairly cheap, but
lacks any of the proper filtering and the usual good design that other,
more expensive amplifiers have.

As to who uses them, that's easy too. People with not too much money,
and even less sense.

Dave

R10 Reference page "NEW" URL

Hello,

The R10 reference page first created by Joost van Stuyvenberg has moved to its new location on The ScanShack.

http://members.aol.com/scanshack/r10/index.htm
or via the selection on
http://www.ScanShack.com

Joost began the R10 reference page more than a year ago but due to other commitments he was unable to continue. Joost put out the word of his intentions and asked if anyone desired to continue his efforts. I answered his request and he was kind enough to accept my offer. I hope that I am able to do justice to this effort and continue in Joosts foot steps. He has given me his original html files to tailor as needed. The look and content will remain much the same.ï¿½ï¿½Thank you to Joost for your trust and for allowing me to continue this effort !

I'd like to wish all a very Happy Holiday !

Have a GREAT one !

Check the ground on your antenna at the base then uas a 3ft jumper and check
SWR at the output of amp if not satisfactory then use a 6ft jumper between
radio and 250XL and Swr is still
high check output of radio it should be no more than 3 1/2 watts max to
sound good.

You need a good low pass filter. Here's a good company I'd recommend to anybody.
http://www.mfjenterprises.com
You'll find a good low pass filter that will handle up to 2500 Watts at
http://www.mfjenterprises.com/filters/mfj704.html
It costs $49.95 but its worth it if you don't want to get busted.

I've asked this question before and got zero response.

Thought I'd ask the new bunch of ng'ees.

Does anyone know of an alive or dead 16-pill Messenger amp for sale?

Buy or swap, I have a ton of gear, test equipment, military, Spy transceivers, ham and CB. If I haven't got it, I know a man who probably has.

Alternatively, would anyone have a good quality copy of the schematic that they could scan or photocopy for me.

All costs covered of course.

Many thanks.

Phil / UK

Handhelds are not as good as mobiles,not even close.A mediocre antenna like a K-40 or Wilson 1000 mounted in the hood channel will work well.I don't think weather channels are worth any extra,you can get the same info from the broadcast bands or channel 19.

Ah, that depends on what you need to use the computer for? What does the software do? If you really want to control the radio from the computer, I'd have to say that 99.9999999% of the CB radios out there can not be controlled by a computer. You need more info or you need to tell us more about the software, its application and the radio you have.

John

Paul, I have had two of those radios. They are great but you need the manual. Try contacting Ranger directly. They have a web page: http://www.ranger-inc.com/

The only reason it sounds louder is because with the swinging output it
pumps the AGC in the receiver, but is actually no more louder than just
a good steady carrier modulated properly.

Ray save your energy you shouldnt see that big of a fs reading change from 350 to 275 watts unless the resolution of your fs meter is very high. i am assuming You did your test for each amp with the same radio, same antenna, and same meter, if so then there is nothing else to compare the davemade did do more watts on your system. .

That's weird. I have had what you consider a "getto type" amp since "96" and it ran great! It was a Pirate made 16 pill and I drove it with a RCI 2900 and 4 pill Texas Star, it was a constant crisp and clean 2000 watts all day and every day. When I sold it, it work as good as the day I bought it. I believe you maybe a little misinformed, there are allot of Hams who's names I will keep anonymous who build these so called "Getto type." amps. Perhaps you need to re-evaluate your misinformation, it only makes you look really ignorant. Don't get me wrong it does'nt offend me, I just hate to see people make a ass out of themhselves and they don't probably realize it.

After useing their ant. and original
power mic. they used to offer a long time ago I bought their system last year.
Doesn't recieve or talk very well stock. Over priced for what you get. Radio
itself is nothing better than the cheapest Uniden you can
by,mic. is just a noise cancel with poor audio. Disappointing to say the least.

Can't that bias be produced with a diode and a resistor in parallel?

Sean, if a box is poorly made and is not tuned correctly to 50 ohms you will see less output, in rays example however he tested the amps under the exact same conditions with the same antenna, and it's same impedance to each amp. Hopefully he has his antenna tuned to 50 ohms or as close as possible because the dave amp is tuned to be 50 ohms or as close as possible.

Sean <bigfoot1@megsinet.net> wrote in message news:wnk84.3$M56.255@news.corecomm.net...

==========
No antenna is exactly 50 ohms either. I have never seen wattage increase from one antenna to another. unless the swr is different on each one

>

There are two small transistors in it. One controls the keyup relay
and the other is the preamp. Most likely a 2N2222 NPN. Texas Stars
use PNP transistors.

I wonder if X force can mold a dildo from Daves dick?

"DriveByShooter" wrote in message news:wRd84.20$M3.1335@news2.voicenet.com...
Wouldnt you know X-Force had there copy machine out again, and took another page from the master again. Dave has been making these antenna mounts for more than 10 years just look around and ask the guys who have them. And now x force has copyed him again with the antenna mounts check them both out you tell me they are not obsessed with davemade . The worst part about it is the price differance. x force mounts sell for $89.99 on sale, where as the davemade sells for only $40.00 everyday price from the guy who actually designed the mounts you pay more than 2x that with the imitation. the pictures are as follows One mount is the davemade the other is the xerox . Happy Holidays

Get the new Libretto for that.

It has Win NT on it, Winamp, a 6.4 gig HD, 64 meg of ram and a WINAMP REMOTE CONTROL!!!

This way, you get a small little remote (handheld, on a wire) to put in the car... Comes with a Yamaha OPL/3 sound card.

I have one, and they FUCKING RULE the MP3 scene.

The 350Z packs everything in the case and uses a different power supply method... The 300A (early) uses a doubler whereas the newer 300A and 350Z uses full wave bridges.

At the current levels involved, you really don't notice any difference, though.

However, the 350Z was known for being the amp that "had 10 pounds of shit in a 3 pound box". Power transformers where known to blow in them.

Tim,

Nothing against your friend,

BUT WHAT THE FUCK IS THE DEAL WITH PUTTING MIDI FILES ON A WEB SITE!!!?

I went to look at something that has to do with radio, and I get a MIDI file?

Fuck people, lay off the goddamned music, wav and other nonsensical files on a web site.

Sorry.. Off the soapbox.

Merry Christmas.

Who gives a shit how many drivers you can put in their....

In the 80s (remember, I am an IASCA certified autosound installer) we where putting 8 12s and 16 8s in Toyota minis...

4 8s in the back, 4 behind the seat for lower mid bass, and then we ran Boston Acoustics Pro 6.2s in the doors... 2 sets.

Tweeters went all the way across the "elongated" rear view mirror, and where controlled by the spatial enhancer.

Power was 8 Orin 2150SX amplifiers.

It rocked... And ran a pair of alternators.

When you can break 154 Db, come talk.

Ray it does make a difference especially on peak power 100/200watts or so and the disparitys between slugs may also show some differances, also Does it have the caps inside the amp if not then you must have dealt with Mr.Gunn. You seemed real happy about the rms watts since it destroyed the skullcraka. What type radio are you using?

3296. Re: WTB: Antenna Bracket

Newsgroup: rec.radio.cb
Date: 1999-12-23 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <3862CA86.C7139DC1@qnet.com>
Source record: 16745

Hello Scott (Unit69): I am looking for a Sigma 5/8 CB Base Antenna also. I have one located a few miles away, but the guy doesn't want to sell it, even for a $100 dollars. So I'll keep on looking. If I had a Sigma 5/8 in hand I could have my machinist make a better heavier duty one.

The problem with a 1/2, 5/8, or 3/4 Wavelength CB Base Antenna, is that it the vertical element needs to be supported, and insulated for the impedance matching system used to transfer the maxim energy to the antenna from the coax. This ain't easy! The Sigma 5/8 and MaCo V5/8 use a special insulator collar type base assembly, that holds and insulates the vertical antenna element. I know the MaCo V5/8 has the insulator pressed into place, between two different diameter pieces of aluminum tubing. Its possible to make one from different diameter sizes of aluminum tubing, and maybe PVC plastic pipe.

The only known guy to have spare parts was:
Van Valzah at phone # 1-630-406-9210 he is in Ill. I called him a few days ago to purchase a Sigma 5/8. He says that he can't make the base assembly any more, and that he charged $280 dollars for a new Sigma 5/8.

Now this is not a rip-off price, the Mosley Devant 5/8 Special goes for around $270 dollars, and the Jo-Gunn 3/4 wavelength antenna goes for around $270 dollars also. The MaCo V5/8 which looks like a Sigma 5/8 is a close antenna in performance, is around $70 dollars. A good buy.

The only good advice I can make here is to find one on a roof and buy it. Or you half to get creative and make your own. If it was a Penetrator 500, or CLR-2 I could send you a New Design, heavy duty bolt-on base assembly.

You can get the Sigma 5/8 assembly plans from Antenna Specialist at 1-800-321-9978.

Let me know how ya make out, and good luck. And Happy Holidays.

Jay in the Mojave

> add 20 more feet to it with out killing the swr's?

Your SWR will be ok as long as the antenna is tuned well. In
fact, because of the amount of loss in that cable, your swr might
even look better at the radio end.
I would suggest that instead of adding more 58 you just buy a
larger diameter cable with less loss.

Yes, it can.

You can have 10 ohms of capacitive reactance on a 60 ohm antenna, and it will look like 50 ohms as far as the reflective component goes, however, it will not put out what it would at 50 ohms because of lighter loading.

> Which is the whole point of the discussion!

No, the rest of us have moved the point of the discussion to pointing out
that your an idiot.

> You have a call sign and your name and
> address are in the FCC's data base.
> No call sign, no problem.

Right. Wait... That fucking petition that keeps going around your
neighborhood, the local authorities, your representative (Tauzin and others)
keep putting this bill up, the locals are tearing down your antenna....

Gee, they don't have a clue one as to who to come and bust, do they?

They don't
> know who you are or where you are
> and they have no way of finding you,

Two words:

DIRECTION FINDING!

> unless they want to spend a whole bunch
> of money.

No, not true. The amateur community holds carrier hunts all the time. As a
matter of fact, I can locate someone fairly accurately with a GC Electronics
10/11 meter loop antenna.

Guess the FCC wouldn't have heard of those, would they?

The FCC busts a couple
> of CBers, then make a BIG publicity
> splash hoping it scares everyone. The
> truth is they do not have the money or
> manpower or equipment to go after
> millions of CBers.

Nope, they don't.

Get one.

Fine them $10,000.00. Now they have the money to go get three more.

Fine them 10K each... Now they have the money to go get 10 more..

See how mathematics works? Pretty simple, isn't it.

they're having enough
> trouble trying to close down a few dozen
> low-power FM (unlicensed) stations

> here.

He himself stated that he was trying to scare nobody, just educate people on what has been happening as of lately.

Lost licenses? Confiscated Gear?
> OH REALLY?

Yes, fuckface, really!

If you don't believe it, go to the FCCs web site and have a look-see for yourself.... That is assuming on my part that you have the mental competence to do a simple search, also.

Please state the call letters
> and names of the hams you are talking about!

Why? I would much rather see you use your head for something more than a hatrack.... Something that it isn't very good at now!

Besides, we have posted the busts here in the past.

> AND the source of your information.

www.fcc.gov

I would think that they <<MIGHT>> know what they are talking about?

>
> FACT: The FCC downsizing in 1996 resulted
> in the permanent closing of ALL monitoring
> stations.

What are these people doing in the Houston office all day then? Oh yeah.. I forgot. Some people just go to a room and hang out for 9 hours a day for no pay, huh?

This would also coincide with the 30 or so busts that happened here in Texas a few months ago.

Mobile monitoring operations ceased
> four years before that.

Proof of your allegations? We have the proof... People have been busted.

Please tell us where you get your info from.....

Wait. I can answer that for myself. Channel 19.

Since 1992, the FCC
> budget has been slashed to a quarter of what
> it was.

Because at the time it was an oversize beauracracy, the money was needed more for other things, our president was a dipshit, and since it happened, the FCC has found other ways to make money like selling off spectrum that is unused... Somewhat like your brain!

Manpower is a third of what it was.

And with the autonomation of the FCCs actions, they don't need many people.

Ever hear of computers?

How many people at Chrysler lost their jobs when Iaccoca brought the robotics in? THOUSANDS...

However, he made cars cheaper, higher quality (disputable) and faster than the rest of the guys....

See the corollary, asshole?

> They can't control ham radio , where they
> use call signs, and you think they can enforce
> CB?

It isn't that they can't control amateur radio... They fucked up and listened to the ARRL years ago and tried the self policing bullshit. This, coupled with a few other bad decisions has nearly cost amateur radio its existance.... However, their is no shortage of "let's show them" busts going on lately.

Again, take a look at http://www.fcc.gov and do a simple search. You will be unpleasantly surprised.

YEAH Right! The one guy doing ham
> enforcement, Riley Hollingsworth, admitted
> on the air that he is doing it from his home.

No, he is not doing it himself... However, he is the guy who has his panties in a wad, and unfortunately for the jammers, freebanders, power running individuals, etc., etc., etc., he is the one with the authority to do something about it.

I take work home from my job everyday, too.... Get a nice tax writeoff from using the HOME OFFICE. Everyone has a hidden agenda.

> He copies down the CALL SIGN of the station
> breaking a rule(s), then writes them a
> warning letter.

Because he HAS to do this according to the FCCs charter as well as the rules governing amateur radio.

You really don't have a clue as to what you're talking about, do you?

He has done NOTHING
> about the hundreds of unidentified jammers
> on the ham bands, because he can't.

That is not true at all. Their have been quite a few NALs sent out, and I know one of the people! He never used a call sign. Explain that one, Einstein.

He
> has no way of locating or identifying them.

Right.

> H AH AH HA HA HA HA CB enforcement,
> RIGHT! More CB linears change hands
> in one weekend in Chicago than the FCC
> could ever dream of confiscating.

Keep thinking so.

Your an asshole troll.

Go lie in the yard and act like the pile of dog squeeze you are!

> If the D104 is amplified (most are) there is no issue with impedence
> matching.

The way the D-104 works, the amplifier circuit will match nearly anything thrown at it.

They work as-is. If the D104 is un-amplified, it is a high
> impedence, and would need a matching transformer. But I suspect that you
> would not be pleased with the audio level from the unamplified mike, on
> anything but a tube rig (they were also high impedence)

If you use a matching transformer, the non-amplified mic will put out WAY more signal than anything else non-amplified today!

High impedance means high voltage.

You can also change the input resistance of your audio preamp chain to work with the high impedance D-104s.... Makes the newer radios have that "tube" sound to them.

Not totally true.

If memory serves me well, the 101s where screen grid modulated.

Screen grid still doesn't have the punch of plate modulation, however, it CAN'T overmodulate in the negative direction, so you can clip your limiters away and be done with it...

Sears Roadtalker 40, CB Base station, has USB, LSB, AM. 40 channels, comes with stock hand mic, in very good condition, works 100%. asking $90.00 + $12.50 for priority shipping.

Realistic TRC-207 40 channel 5 watt walkie-talkie with rubber dukie antenna, and green LED readout. Works great, very good condition. Price $20.00 + $5.00 for priority shipping. Batteries not included.

Realistic TRC-221 40 channel 5 watt walkie-talkie with center load telescopic antenna, has LCD readout for signal, power, battery and channel. Also has jacks for; speaker, ext.mic, ant.,chg.,pwr. This unit is in MINT condition, was used only 2 times, was bought a few years ago and been stored in its original box since, comes with owners manual. This radio was the TOP OF THE LINE a couple of years ago. Works perfectly, batteries not included. The price is $65.00 + $6.00 for priority shipping.

Midland 75-810, CB walkie-talkie, 40 channel 7 watts input/4 watts output power with Weather monitor, receives all 10 U.S. N.O.A.A. weather channels. LCD readout has large numerals, a sequential power/signal meter and indicators for high/low power, EMG, CB/WX and keyboard lock. Last channel recall. Two memory channels. Channel Up/Down, Emergency and lock features. Jack for external antenna, external 12 VDC power, charging, earphone, remote mic or speaker mic.
Comes with rubber antenna, cigarette lighter power cord, box and owners manual. The price is $69.00 + $6.00 for priority shipping.
This unit is BRAND NEW, never used. Batteries not included.

sorry no C.O.D.`s or checks.
U.S. Postal money order only.

Hello Bob C.: Good call on the larger and better coax. About a month ago, I was comparing two 5/8 wavelength base CB antennas. Trying to get a new design proto-type antenna to have a better band width than the old Penetrator 500. After trying a bunch of things, I finally installed exact length of coaxes to both antennas, and guess what! The band width was just a tad better on my new design antenna. The original length of coax to the new design antenna was about 12 feet, and the length on the Penetrator 500 was about 60 feet. It makes a big difference, from the coax insertion loss!

Jay in the Mojave

In other words.............A TOTAL FLOP. It will most
likely be discontinued after one year of the lame
brains at Radio Shack attempting to sell this radio to
a market that does not exist.

Well every radio is a little different depending on when it was built. The
Cherokrr CBS1000 base is a good excemple if one opens up the Mod in this
radio a lot it will most likely take out
the power supply if the radio is used a lot. If you take a Old Cobra 148GTL
and open up the MOD and use it in a car or truck it will work just fine or
use it as a base on a 5AMP Astron power supply no problem, but if you use it
on some of the other power supply that are out there
use one of a higher rating and you will be OK. 73s

3326. Re: Best CB/AM/FM Antenna?

Newsgroup: rec.radio.cb
Date: 1999-12-23 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <CJq84.879$GF1.57310@newsread1.prod.itd.earthlink.net>
Source record: 16775

Well, I've built a band-splitter for AM/FM/CB, and the approach
you show in theory would be close to a Firestick hooked directly.
But you will always have losses in the band-splitters. In this case,
the loss shouldn't be that excessive, but it will still be there. The
only reason it shouldn't be too excessive is it's not trying to tune
the antenna, it's just 'passing through'. Most of the AM/FM/CB
adapter boxes are designed to make a non-CB antenna function
as a CB antenna as well as be a band-splitter. In that respect,
they will work no better than just trying to tune that non-CB antenna
in the first place, and then have additional degrading from the
band-splitter working with elevated voltages and currents that
are present in trying to 'correct' for the antenna.

3327. Re: What mic has that great sound?

Newsgroup: rec.radio.cb
Date: 1999-12-23 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <d0v84.1364$GF1.68335@newsread1.prod.itd.earthlink.net>
Source record: 16776

You know, years ago I took a trade on a Turner M+3 mobile mic.
It didn't work so I gave the guy a few bucks for it towards another
mic cause he didn't have the cash for another one. I threw it in
the drawer and forgot about it.

Till one day I dug it out. Besides the fact that the connector was
butchered beyond belief and I had to just cut off about 3 inches
of cable. I put on a 5-pin din to match my TRC-449. Then I
tore the mic apart to find out why it wasn't working. Well, it had
a 'crystal' mic that looked like a big disk with foil stretched over
it. It was ripped to pieces. It looked like it got something on it,
and then someone took the mic apart and tore it up. No wonder
it didn't work.

Well, Radio Shack sold replacement ceramic mic elements back
then (1977) for about a buck or so. I cleaned up the mic case and
the innards, and threw away the ripped mic. I then 'fudged' the RS
element in there and popped it back together. I had LOTs of
people tell me they liked that mic! Only catch was, it was just too
'easy' to bump the volume control. And the first time the battery
went dead ticked me off, so I fed the +12 line to a pin on the mic
jack through a resistor (just in case!) and then put a zener and a
cap in the mic instead of one of those expensive batteries. (If I
recall, it used a 7v thing that cost something silly like $6!)

I later got rid of the thing, don't know why, something new I suppose.
Then turned around and got the Radio Shack mic that looks like
the one they still sell, only now it uses standard batteries, then the
RS mic used that same expensive 7v battery!! The RS mic is ok,
but absolutley nothing exciting. Noise canceling is decent, but it's
not near as 'crisp' as the Turner was. The big advantage of the RS
mic is that the battery compartment had a 'switch'. If the battery
was removed, it would bypass the amp and still work as a standard
mic. But if the battery was still in place, it had to be good.

Hi

I had asked the original question about the 148's.

What radio would you reccomend then forgetting about the cobras... One that can still be frequed and tuned? How about withinn the $150-$200 range?

I still have time to decide on the radio as I won't be able to get one until after the new year.

Thank you
Anna

definetly a low pass filter,but also invest in a balun to keep tvi/rfi from radiating off of your antenna...and keep antenna as high and away from everything as possible..and keep coax length to a minimum,wind any exess around antenna mast or whatever is mounting antenna,also wind any excess wire from phones.thats a good start,but with 1,000w of pwr you are going to need a little luck and trial&error until you get it right...good luck and 73's

If you are referring to the new HTX10 ($149) rig,
no. This is a rig intended for use by licensed
hams within the 10M 29 - 29.7MHz ham band only.

- no jumper-cuts or resistor/diode addition/removal
for "Euro" or "international" operation;

- PLL synth and control CPU on same chip; PLL divider
is not externally programmable and only is
controlled by internal CPU programming, which
cannot be changed/subverted, etc.

- Fast PLL main loop so no offset mixer osc. setup
that has a crystal that can be changed;

No other xmit mods are sensible either - finals run at
near max safe rated power; playing w/ALC, etc. doesn't
make sense as the radio usu requires mic gain to only
be run in the 1st 1/3 or 1/2 the dial...

Okay, I'll take it apart and give it a good clean up. Next year, when the weather warms up here in the Pacific Northwest (darn, its cold out there), I'll stick it up just to see how it performs. It'll be fun messing with it if nothing else.

> .....on second thought if you want to get rid of
> it.....I can give you my mailing address <G>

Now BK, if I'm going to go through all that effort to take it apart (for shipping), I'm just going to clean it up and try it out myself. Of course, if I tear it up during the take-apart, cleaning, and re-assemply, I'll keep you in mind. :-)

No, a "10" on the troll-o-meter would be far more sophisticated. This
was a pretty lame troll attempt. I'd give it a one or one point five.

> Thanks to all of the [unanimously negative!] responses to my query
> about the best CB/AM/FM antenna/splitter.

A splitter will work if you have absolutely no other option available. However, if you have any other option, I would suggest that you try it first - an AM/FM antenna is simply not going to work very well as a CB antenna. That might not be the answer you wanted, but it is the truth.

Even for an all fiberglass vehicle, there are stick-on window-mount antennas that will perform better than the AM/FM antenna (and the stick-on window-mount antennas perform very poorly).

Here are some basic guidelines. Most of them are common sense and others come from experience. Much of this information can be found in the ARRL Handbook or their Interference guide.

Keep the audio levels reasonable. Power mics cranked way up are GUARANTEED to create problems. Even with barefoot radios.

Drive levels should be kept below the point of saturation when using an amplifier. If your amp is capable of 1000 watts max output, using 800 "clean" watts is far better than using nothing at all. These figures are strictly for example purposes only and not to be taken literally.

All components must be chassis grounded to a common copper bus bar. This bar is then connected to a REAL ground rod. Use heavy wire from the bus bar to the ground rod and keep it as short as possible. DO NOT ground your components to the electrical outlet.

I have seen benefits from using power strips with EMI / RFI filtration in them. This helps keep RFI from getting back into the electrical system and polluting your neighbors. Make sure that the strip can handle the amount of power that you intend to pull out of it. I have also seen these do wonders by plugging your neighbors tv / stereo systems into one of these. Keep in mind that not all of the power strips with filtering are created equal.

The installation should look as follows: The radio should feed a low pass filter into the amp. This reduces the amount of harmonics that the amplifier sees, so it doesn't try to reproduce them. If you don't do this, the amplifier DOES reproduce the harmonics that the radio is producing and reduces the efficiency of your signal on 27 Mhz. It can be the difference between really clobbering your neighbors big-time or barely interfering at all. From there, the amp feeds your watt / swr meter into a 2nd HI POWER low pass filter into antenna. Keep in mind that TVI filters MUST be earth grounded to work properly and should always be the last piece connected going out towards the antenna. You might also try removing the meter from the line if you don't use it all the time. I have situations where just placing the meter in-line was the difference between TVI and no TVI.

Use QUALITY coaxial cable and keep the run as short as is reasonable. 95% shielding is a must. RG-8 or RG-213 works much better than running RG-8M or RG-8X. The mini 8 exhibits twice the loss with much greater leakage on long runs. This is not to mention that i don't feel "comfortable" running more than about 800 watts peak through it, although it can be done.

Some antennas benefit from winding a choke directly under them around the mast. Do NOT do this if using 9913 type coax, as it could create MAJOR impedance bumps. This would include, but is not limited to: A99's, I-Max

2000's, Shakespeare Pogo Stick's, Cushcraft CR-1's, etc.... These are all end fed designs with no counterpoise to de-couple the RF from the coaxial cable's shield. This consists of appr. 8 turns of coax tightly wound side by side around your mast. If you have a long section of mast, try doing this appr. 8 1/2' - 9' from the bottom of the antenna. If your mast is not that long, do it directly below the antenna.

While this one may sound dumb, DO NOT stick an antenna directly down into a tri-pod. Use a piece of mast between the two, even if it is but a few feet. You also have to remember to keep the top of the mast slightly below the top of the mounting hub or any tuning devices (rings, loop, etc..) that the antenna may use.

Even when using the "ground plane kit" for A99's and such, the choke is recommended. This is due to the fact that the radials on this kit are not the correct electrical length and do not function as well as intended. Replacing the "shorty" radials with full length 1/4 wave whips will not only help performance, but also help to reduce interference and widen the antenna's bandwidth.

Antenna systems need to be properly tuned and grounded. This means a direct connection to the antenna hub, NOT the mast or tripod. It is okay to ground the tripod ALSO, but don't count on this alone. Towers should always be grounded at the base also. Antenna's should be installed as high as is SAFELY possible. If using guy lines, DO NOT use wire. Polypropylene or Nylon rope of proper strength can reduce interference and will not affect the antenna's radiation angle. These may require occasional tension adjustments though, especially after the first few windy days.

All connections need to be properly weatherproofed. This does not mean electrical or duct tape. Use coax seal (available at Rat Shack) on coax and ground connections. It remains soft and pliable for ease of removal for maintenance. It can be easily removed by making a simple slice and peeling it off. You can then re-mold it once your done. Use silicone on antenna joints and seams that are of a more permanent nature. DO NOT use silicone on coax connections.

When using multiple ground rods, they must be "tied together". This means that you need to connect them together via a low resistance path (heavy wire). This means that ground rods should be located on the same side of the house if possible, but slightly spread out. Otherwise, you could develop problems with ground loops due to differences in ground potential. I have seen as much as 40 volts appear on a system that was suffering from this problem. Talk about getting "bit" from a microphone !!!!

If you follow these relatively simple instructions and concentrate on doing a quality installation, your problems will be minimal. If you have problems after doing all of this IN THE PROPER FASHION, go to this website and download this information for your neighbors.
http://www.fcc.gov/cib/Publications/tvibook.html It also helps to point out that cordless phones have minimal filtering in them. This can be verified by having your neighbor read the bottom of the receiver, which

states " this device must receive all interfering signals", etc... If this is your main problem, you might want to suggest that they check into a 900 Mhz cordless unit. These are far less susceptible to interference and can now be had for about $35 after rebates.

Hope this helps. Sean

>Must be an authourized dealer?
>
>

Why yes we are. I have sold a few. It is over prices but that is if you buy it separate. We have had no problems with the mic and poor audio. Every one of our customers have been tickled. K40 will take care of their customers. The mic however cannot be repaired if a switch breaks or mic element goes bad. There are not parts available. But Some of the systems I have sold are running strong. If you buy the whole system with the antenna included its not such a bad deal. If you have problems with K40 stuff let the people you bought it from. If they are authorized dealers they can get it taken care of for you. I did not say they would, they could. Depends on your shop and the problem.

Ok. Hope that answered the original Question that was if Anyone new about the radio.

Thanks Ray. Glad to hear that she's still strokin'. Don't know if you know him or not, but "Stan, the NASA man" has a VERY hot PC 76 down there too. He is running a modified 667 that Dennis worked on with a Stargun Bopper.

I like the older Uniden built (Philippine's or Taiwan chassis) Cobra 29's or the Uniden PC 76 / 78's best. The 25's of the same era and the Uniden PC 66 / 68's also run well. These radios have the advantage of running the finals at higher modulated voltages and can really scream when done up right. Of course, some radios run hotter than others due to parts tolerance and loading characteristics.

To get a radio that uses an AM Power Regulator (148's, Grant's, Galaxies, RCI's, Mirage's, etc.... and most other ssb / export radios except the 2510 series) to do numbers that are equivalent requires modifications that i don't recommend be done to radios that are run on a daily basis. Sure, you can do them, but they typically reduce the lifespan of the radio, eat up more parts and typically increase harmonics / imd pretty drastically. Just my opinion. Sean

Sounds like your using the swr meter in the radio. This is going to show
you the swr going into the amp and how well it's input circuitry is tuned.
Other than re-designing the amp, you can play with jumper lengths. This
will affect the impedance that the radio sees and will therefore "trick" it
into thinking that it is actually going into a better load. You'll be able
to see the differences not only on your swr meter, but also on the S/RF
meter and how the radio loads up. Sean

Now that i know who you are, see Toll's response up above. A "50 ohm antenna system" can be a mass combination of several factors. Some of them are less than favorable in terms of loading up power. How each amp deals with it is strictly up to it's design.

In RAY'S system, the Dave did do more power. The Skull may have a drastically different output impedance other than the impedance presented to it and therefore wouldn't load up optimally. While i have no doubt that the Dave Made is a more potent box, it is possible that the Skullcracka could load up more power IF the impedance of the antenna system is perfectly matched to it. Who knows, it could be anywhere from 10 to 100 ohms ????
Sean
>

DriveByShooter > wrote in message <0my84.186$Re.4471@news2.voicenet.com>...
Sean, if a box is poorly made and is not tuned correctly to 50 ohms you will see less output, in rays example however he tested the amps under the exact same conditions with the same antenna, and it's same impedance to each amp. Hopefully he has his antenna tuned to 50 ohms or as close as possible because the dave amp is tuned to be 50 ohms or as close as possible.

As Toll states, there is a lot of various factors that go into producing a so called 50 ohm or "flat match" system. By altering the levels of capacitance and / or inductance slightly, you can really begin to see some different numbers. This is true even though the end result still shows up as a flat match and appr. 50 ohms.

Once the maximum power is transferred into the antenna, it's radiation efficiency and radiation angle are what determines how far you'll get out and if you can shoot skip on a consistent basis. Even though some antennas may produce equivalent loading into them (amp delivers equal wattage into both of them), one may talk noticeably better than the other. This can be due to several factors.

One of them is conductivity. Copper and Aluminum radiate much better than steel. Chroming an antenna is not much good for anything, other than looking fancy and peeling from weather while reducing it's efficiency.

Another is loading loss in coils. Coils with more surface area and that are "air wound" offer lower loss than coils that use wire and are wound on some type of former for support purposes. Winding the coil directly against the former also reduces efficiency by increasing thermal losses.

Radiation angle is EXTREMELY important. Think of your antenna as two different types of weapons. One is a bazooka. If it hits the target, it can do major damage. If it misses, it's all over. Kind of a "one shot wonder". The other is a shotgun. While it isn't as precise, it has the potential to hit the target much easier, but with less impact.

Some antennas do produce strong field strengths, but concentrate the signal at an angle that is not real usable for most of what we want to do. This can be EITHER a high or a low angle of radiation. What we are looking for is an antenna that has high field strength (the bazooka) but concentrates it on the horizon or slightly above it (the spray of the shotgun). This gives optimum ground wave with excellent opportunity for working DX. All things being equal, the antenna that has better long distance ground wave coverage will typically produce better results in DX land also.

Now that i've rambled on long enough, what "Bad Boy" are you running Ray ? Is it the vertical or the "flatsider" ? Sean
>

Toll Free wrote in message ...
Yes, it can.

You can have 10 ohms of capacitive reactance on a 60 ohm antenna, and it will look like 50 ohms as far as the reflective component goes, however, it will not put out what it would at 50 ohms because of lighter loading.

snip

You are wrong here. The definition of peak power is the RMS power measured at the peak of the modulation envelope.Not the instantaneous power measured at the peak of the RF sine wave. Since there is no modulation envelope in a carrier then there is no to increase in the measurement. They are the same.

|> louder... period... Quality is more less in the eye of the beholder....
|> sooo... But, as far as Cleanliness, I would have went with the 25 LTD
|> STOCK!..... but, you rarely need clarity when someone is busting your
|> speaker out because they are so loud.....
|>
|
|There's a old saying: There's no such thing as a free lunch, and it
|applies in this case as well.
|
|Your test scenario is all well and good, and I agree with the results
|that you will see. Now, repeat the test at about 8 or 10 miles out, and
|see what happens. While your peak modulation power will be the same, the

|carrier power with the swing kit will be less, resulting in a weaker
|signal level than the radio with the full 4 watts. During periods of
|"lesser" modulation, your signal, with the swing kit, will be subject to
|interference from other stations with slightly stronger carrier levels.
|
|While is is true that your modulation is what carries the intelligence
|in your transmission, the carrier is what quiets the receiver, and
|blocks out background noise.
|
|I've listened to "swingers" in the distance, and they are usually much
|harder to copy than someone with minimal or no swing. The rapid changes
|in signal cause the receiver's AGC to have fits trying to keep up with
|the wildly changing signal levels. Many of these people also, for
|whatever reason, get distorted by the noise blanker of the receiver (I
|have to turn it off to understand them clearly). I don't know if this is
|a result of excesive swing itself, or distortion products that are
|introduced as a byproduct of the negative cutoff, or just a badly tuned
|amplifier.

I would like to find out what the best radio I can get for about $200,
forget the 148 GTL.

What about the 2510 radios?

Thank you!

Anna

hr2510.

Great radio. But.

The finals have been discontinued long ago. You will not find a new 2510 unless a shop has horded a few.

Get something that you can have maintained. Are you a side band user? What do you want your radio to do. Those will be the key factors to what radio to get.

Ok. Hope that helps.

The President Lincoln is just like the 2510.
Again. Make sure you can get your unit maintained.

God Bless Happy Holiday

prozac 625 wrote in message <5lg84.7999$mv4.385593@news.rdc1.nj.home.com>...
I wonder if X force can mold a dildo from Daves dick?

"DriveByShooter" wrote in message news:wRd84.20$M3.1335@news2.voicenet.com...
Wouldnt you know X-Force had there copy machine out again, and took another page from the master again. Dave has been making these antenna mounts for more than 10 years just look around and ask the guys who have them. And now x force has copyed him again with the antenna mounts check them both out you tell me they are not obsessed with davemade . The worst part about it is the price differance. x force mounts sell for $89.99 on sale, where as the davemade sells for only $40.00 everyday price from the guy who actually designed the mounts you pay more than 2x that with the imitation. the pictures are as follows One mount is the davemade the other is the xerox . Happy Holidays

The software its called DTI4. It gives us a ton of memory banks for storing channels in it and opens up the PLL chip. Basically scan freq u normal can't get on regular 40ch CB is the way I'm understanding.

There is suppose to be only certain radios u can do it on, but the guy doesn;t list them and doesn;t even give u the schematic for hooking it up to the computer. Its basicall the Parrel cord wired into certain pins on the PLL chip and then hooks to the computer via the parrel port..

All post this guys web page in here as soon as I find it again. I havwe sent him several e-mail, but they come back as wrong address. Rogers Work Bench is the name of the Page..

Source record: 16847

Hello Speedbuggy714: Good call there, I just visited the web site at:
http://www.wolfradio.com/

I have not seen this type of antenna before. The Penetrator 500 and
CLR-2 also used capacity hats, and this "Wolf Point 64 wave omni" uses a
top capacity hat, and two coils assemblies never seen before in a CB
Base Antenna. But certainly in mobile antennas. The manufacture says
that the use of the coils and top hat helps to increase the antennas
efficiency.

Top hat assemblies on top of a antenna add capacitance to antennas
circuit, which results in a shorter length vertical element, and the
matching system is made simpler, along with this comes the price of a
narrower antenna bandwidth. But using coils or inductors with the
capacitance hat, is a new twist to me.

One of the biggest problems with CB or HF type antennas, is, measuring
the antennas elevation, or take off angle. Wolfradio shows the
analytical (figured from a computer) of what the elevation angles are
supposed to be for a 1/4, 1/2, and 5/8 wavelength vertical antenna,
which is a good call, to show why a 5/8 wavelength antenna is desirable.
And he goes on saying how the combination of the coils and top hat
assemblies increase the efficiency of the antenna. The $64 dollar
question here is: Did he figure this buy simple antenna field strength
measurements, or actually rotating the antenna in a horizontal position
and measuring the elevation angle, or from a computer? I'd love to know,
but when you brain storm new stuff, and you fill in a lot of writing in
the "Lessons Learned" chapter of your notes, you don't always share!

At $125 dollars, this is a good deal, if the antenna works like the
manufacture says it does. I just might buy one.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the
road ah ways from the fillin station.

>>measurement. They are the same.

Snip

>Whether or not the definition you listed is correct or not is the question
>in the first place. Just because it is what is "accepted" does not make it
>correct. Sean

snip

If it's accepted then it is supposed to be used. This will keep
everyone talking apples when apples are discussed and oranges
when oranges are discussed. If a 100 watt carrier is 200 watts
peak (according to you) then you'd better find a new term to
describe this type of wattage. PeaK is ALLREADY taken. Try
200 watts instantaneous.

Sorry Sean, but just because you say it dosen't make it right, I repeat,
it dosen't matter, a 4 to 1 peak ratio is correct for 100% modulation
for sine or complex waveforms, wheather you agree with theory or not.

Your better off going with a buss bar and crimp type of arrangement.

I use eyelets soldered on to the ends of my cables, then a screwdriver type compression fitting to couple cables together.

The plus.. Less voltage drop, you can connect more than one thing to the cable, and they are usually cheaper!

The negative.. You need to have a Phillips screwdriver around...

However, I keep a complete toolkit in my suburban, so it doesn't really matter ....

I have tried the quick disconnects, and over time, I have seen nearly 1 volt drop across them.

O.K.

It's Christmas, and I aint out here to argue, but it is close to 20 grand.

Let's see... their are now 2 pills holding 750.

Multiply that by 32 and what do you get???

24 grand.

Gee.. Guess if you are running a battlebox on 22+ volts (this one gets hit with 28+ in the last 3 seconds of the key), it would be entirely possible, wouldn't it?

Lets keep it simple. You can refer to all the major bust you desire, but the truth of the mater is, any lame idiot with both hands tied behind his back could bust these idiots .Hell what the guy did, who interfered with communication between aircraft, could be considered by many, as a act of terrorism. No wonder the FBI was involved. And in turn they most likely involved the FCC as a after thought.
The bottom line, these cases and all others that are published are high profile cases. The type that draw so much attention they almost prosecute them selfs.The type that can be processed and prosecuted out of a office with local law inforcement doing all the foot work as a " FCC Representative"

Key word: Propaganda. The spreading of ideas or information to further a cause.

Other words publish the few easy bust with high fines, claim a step up in inforcement and hope all the suckers buy into it.

>The FCC levied a $7500 fine on a New Jersey ham who allegedly interfered
>with a net operation on 40 Meter SSB. James C. Thompson, KA2YBP, of Waretown,

>The FCC charged Thompson, 58, with illegally retransmitting programs from
>a Standard Broadcast (AM) station and willingly interfering with the net.

>November, the FCC named two hams among the operators of four unauthorized HF
>broadcasting operations.

>Georga man
>for allegedly interfering with radio communication between aircraft and air

>I mean look at Bill Clinton. See how lucky he is to live in this country????
>
>

No doubt!!! Very comical.

>And I certainly understand your views. But we
>do,. have it a lot better than most.
>

You are correct. Also, we have had it better, a lot better than most for many, many years. It just upsets me to see everyone let it go so far downhill.
For comparison, if this country's quality of life and total overall score was put on a scale of 1-10 and it was an 8 at one time. Lets say the rest of the world was a 4 max. We have been so happy and dwelled on that 8 that we have slipped to a 6 over the years.
Some think if the rest of the world has also slipped to 2 then it is ok because we are still the best. Not good enough for me.
If we were an 8 at one time we should have forgotten about everyone else and strived for a 9. I guess its called complacency.
I know it is a silly example. I believe it gets the point across though.

An antenna's impedance is made up of several factors. MOST analyzers strictly compound these and give you a summary as the impedance. The newer MFJ 259B and the AEA give you a read-out of various components that account for the reactance and other information that can be vital to "fine tuning" an antenna system. I'm sure that the Bird analyzers do this too, but those are a bit pricey.

So to sum it up Ray, yes, your antenna's actual radiation resistance can be anywhere on the map. It might really be 12 ohms with 38 ohms of reactance or ground loss making up the difference. 38 + 12 = a 50 ohm total. The higher the reactance and the greater the ground losses, the tougher it is for the amp to load up and the poorer the radiation out of the antenna. Even with all of this going on, you can still show a flat match and protect your system from high amounts of reflected power. You just don't get the absolute max of what the amp is capable of and signal strength is not as good as what a less reactive / lower ground loss antenna would give you.

If all of this sounds very complex, it is. Unless you really get involved and go to town on reading and learning, the method that your using works quite well for what it is. For the given antenna and vehicle that you have, your installation is probably only down a very few percent from what it is truly capable of. Sean

Toll, no arguements here but I would like to see these 750 watt 2 pills I want to buy one today if it doesnt hold the 750 with a cobra 25/29 and do the appropriate peak on the bird which is 2.82 x the rms so we should see 2100 peak watts. I want 3x my money back from the maker if it doesnt do this. Since when is a 64 or 32 as effiecent as a 2 pill Take a normal exceptional running 2 pill that holds 500 watts x that by 32 and there you have 16kw which is still a high number in my opinion. We can even go a few steps further How many alt on the 64 pill itself,If the 32 needs at least 3 a 64 would require 6. How many for the driver ? The 64 would require at least a 16 pill for drive Which everyone says needs at least 2 alts How many to run the truck,radio and predriver? Mulehead in Missisippi this year with his 3cx3000 keyed with a 64 pill, "no one wanted to key against him with ac", and I know his ac box does not hold anywhere near 20 kw Listening to the tape You could not tell the 64 even keyed. I just find some of this info hard to believe. I hope who ever has these 2 pills that do 750 are at the Ohio break since there 8 pill should hold 3000 watts enough to win the $2000 prize.
Merry Christmas Till and your family.

Okay, let's sift through the pile and see what's in the low profile category. Here's some stuff in the cordless telephone folder:

FCC Field Reports concerning:

Gordon B. Reese III, KF6QKA. "Engaging in rebroadcasts of cordless telephone calls and other broadcasting, along with profanity and obscenity."

Timmy O. Sheen, Sr., N6MZA. Alleged jamming and rebroadcasts of cordless phones.

Mervyn Ehambrave, San Francisco, CA. Alleged unlicensed operation on the K7IJ repeater.

Jmes C. Walker, KF6VAA; Michael J. Nichols KF6UAS; Eric B. Shuler, KF6BMG. Used a 2-meter repeater before obtaining their Amateur licenses.

Blake B. Jenkins, N6YSA. VHF/UHF privileges suspended 120 days for using his ham station "to solicit the jamming of licensed repeaters."

Ben Dowers. Picking his nose while talking on CB Channel 35. (Okay, Okay. So I made that one up. I'm into the Christmas spirits, already, hee hee).

so anybody that has ever bought a dave made mobile dc box that didnt do as much as claimed can give it back to you for a refund three times of what they paid? since your the man himself. tell us what figures you the builder see out of the davemade mobiles so we'll know if we should get that fantastic refund or not. surely you wouldnt demand something of another builder that you wouldnt do yourself. or would you?

Here's a good question for you Debby . With so many radios produced that took that MFR477 final , why was production ceased , I notice that most CB shops dont have any problem at all finding them for about $45, quite overpriced when you look at the price most other transistors go for ??????

3428. Re: watts vs swing

Newsgroup: rec.radio.cb
Date: 1999-12-24 00:00:00 UTC
From: John Gervasi <jgervasi@bellatlantic.net>
Message-ID: <3863B677.A2C0C3C9@bellatlantic.net>
Source record: 16877

The mod I am referring to is one that controlls the voltage applied by Q51 to the dual finals of a RCI 2950. The mod is a diode and resistor combination that applies the AF signal to the two finals and driver for high-level modulation. Unfortunately I do not have a spectrum analyzer only a 100MHz scope. so you are right, I don't really know how much power I am putting out in the base frequency but on the scope the signal really jumps with a positive envelop. Humm, I wonder how much a spectrum analyzer would cost used?

Later,

John

3429. FOR SALE: Texas Star 667V

Newsgroup: rec.radio.cb
Date: 1999-12-24 00:00:00 UTC
From: John <mrbreezej@netscape.net>
Message-ID: <3863B861.3F7B0356@netscape.net>
Source record: 16878

OK, I don't know why no one has jumped at this offer but the real clean 6 months old TS 667V is still for sale. It does a true 300W on an average reading meter with about 10W in. The signal is clean, no appreciable harmonics like most other amps! I have tested this with and without a low pass filter, no change in reflected power when testing SWR into a fairly narrow band antenna. The amp has a 10db gain receive pre-amp and SSB delay. This is a bargin at $300. New for the same amp is over $400 and you will have to have it moded to remove the CW mode electronics and you may get one that splatters like one of the first ones I had. If you buy this I can get my new 1200 :-)

John

Man, you guys wax philisophical all wrong. CB is like a capatalist
society. Ham radio is like a communist or facist society.

With CB, you can have a big amp and be heard, however if your a moron,
most will probably not want to listen to you, and they don't have to.
However, if you are the talented individualist that we know you are,
even without high output power, people will want to listen to you and
you'll be succesful on the band. If your a moron, then just like in
real life, you will fail and people will walk on you.

With ham radio, everyone is allocated a set amount of time to talk,
given a conforming serial number to identify, and everyone is required
to listen to someone, no matter how moronic they are.

Thats why CB is so succesful! Its a free kind of a thing....

> as claimed can give it back to you for a refund three times of what they
paid?
==========
Tim they will do the numbers that they claim to because they are usually
under rated numbers on daves part ,but If it was sold to them with a 3x
back arrangement and it didnt do as expected they should get there money
back. This keeps the overinflated claims to a minimum.

> since your the man himself. tell us what figures you the builder see out
of the
> davemade mobiles so we'll know if we should get that fantastic refund or
not.
==========
Tim, sorry I am not the man, I have a fulltime job I work on doppler radar
systems but if I made a claim that was far over and above what the rest of
the amp builders are seeing out of 2 pill, and it didnt do anywhere close I
the consumer would either want my money back or an amp that lives up to this
fabulous claim. Otherwise, it is just that a bogus claim with no backbone.
There are enough davemades out there for people to compare the numbers to
and you will see with comparable setups the same numbers as well as what
they are claiming to do.. Everyones meters are different and you will see a
few percent differance in your readings from one meter to another, but to
claim your amp will do 50% more than the best amps that are already out
there is a reach for me,and that need some type of assurance, guarantee
that you will see these numbers. I know my mobile is setup as well as
anyones I should be able to duplicate what they are seeing Hell I would even
settle for a 700 watt 2 pill

> surely you wouldnt demand something of another builder that you wouldnt do
> yourself. or would you?
==========
Tim, If the maker is confidant you will see the numbers he is claiming he
would sell you the amp under those conditions a 3x back guarantee If he is
not confidant he wouldnt go for that deal. If I told you a 2 pill was going
to hold 450 watts you can best believe that it will do that, especially if
there was any type guarantee.

Let me make this very easy for the average Joe!

A.) If your radio does not put out enough power for you, buy a dave made!

B.) If it still doesnt put out enough power for you, buy bigger dave made.

C.) If that doesnt work try upgrading your alternator system and adding a few batteried.

If your still not happy repeat steps A, B, and C.

TRUE

If your a moron, then just like in
> real life, you will fail and people will walk on you.

Must be alot of Morons or is that inconsideration?

>
> With ham radio, everyone is allocated a set amount of time to talk,
I was never told I had a set amount of time to talk, except in nets
where each shares his thoughts to be discussed by the group (democracy).

> given a conforming serial number to identify,

Oh, you must mean a callsign more unique than my name?

and everyone is required
> to listen to someone, no matter how moronic they are.
>
Not really, but we still have on-off switches.

> Thats why CB is so succesful! Its a free kind of a thing....
Prolific, yes, successful, (only in certain terms), unorganized, yes,
ad-hoc, yes, wonderful-All radios are wonderful, especially with a good
friend on the other end.
Merry Christmas 73 de Martin (Landman) N5PZJ

||> STOCK!..... but, you rarely need clarity when someone is busting your
||> speaker out because they are so loud.....
||>
||
||There's a old saying: There's no such thing as a free lunch, and it
||applies in this case as well.
||
||Your test scenario is all well and good, and I agree with the results
||that you will see. Now, repeat the test at about 8 or 10 miles out, and
||see what happens. While your peak modulation power will be the same, the
||carrier power with the swing kit will be less, resulting in a weaker
||signal level than the radio with the full 4 watts. During periods of
||"lesser" modulation, your signal, with the swing kit, will be subject to
||interference from other stations with slightly stronger carrier levels.
||
||While is is true that your modulation is what carries the intelligence
||in your transmission, the carrier is what quiets the receiver, and
||blocks out background noise.
||
||I've listened to "swingers" in the distance, and they are usually much
||harder to copy than someone with minimal or no swing. The rapid changes
||in signal cause the receiver's AGC to have fits trying to keep up with
||the wildly changing signal levels. Many of these people also, for
||whatever reason, get distorted by the noise blanker of the receiver (I
||have to turn it off to understand them clearly). I don't know if this is
||a result of excesive swing itself, or distortion products that are
||introduced as a byproduct of the negative cutoff, or just a badly tuned
||amplifier.

Hams are not required by any law to wait their turn to speak, or listen while others are speaking. They do it out of politeness and consideration for other people, just as one would in real life.

It can be done. However......when you are talking RF, MOSFETs can become even harder to drive than bipolar transistors. This is due to the capacitance between the Gate and the Source & Drain (depends upon config, but it'll always be there). What makes it particularly interesting is the capacitance is dynamic! There are other considerations but I don't know how deep you want me to go. If you held a gun to my head and told me to design and build a FET RF amplifier, I would plead that it be FM or CW only.

I live in a town of morons who have almost all been served with FCC papers and even some have been paid a visit. They were busted because they were constantly using foul language and they always key up during prime time. They dont even like DX, they would rather keep up a pair of 3-500z to talk in a 30 mile circumference. Skip starts rollin in and they go back quiet, they hate skip. Its a trip.

dear santa,
this is ice cream man and i would like to put in my request for my Christmas presents. I would like the following items

1. a 48 pill solid state amplifier
2. a dead motor maul for the above amp.
3. a very large leece neville alternator
4. a large rectifier assembly
5. a reason to buy all this stuff.

i feel i qualify for the above presents because i have been a very good boy all year long. i have not chunked any comments at truck drivers or security guards all year long. i have worked hard at my job which i like very much. i have tried to temper my comments on the cb radio ng so that all my little buddies will like me,..he, he. i have suffered constant unwarranted verbal barrages from the ng owner and operator, tool free and have not uttered a word in my defense. i have been bending over backwards to try and be nice to all my little newbie friends and ham scumbags. i hope that you being the person that you are , santa, that you will see fit to give my request careful consideration. my chimney has been cleaned and greased and the Christmas tree lights are on. i have listened intently to the mini bowl and the super bowl and have been brushing up on my ebonics so that i will fit in someday , hopefully. santa , i have been trying real hard to be sensitive in the face of unbridled ignorance eminating from places far and wide across the band. i have stood in silence as my dad , hillbilly does he what he does best. that is of course his habit of remaining distant and exercising disfunctional neglect while things happen on this ng, that require his immediate attention, such as ham radio operator encroachment issues, behaviors such as constant harrassment of his son, ice cream man by some of these punks, oh excuse me, some or these guys on this ng and his preoccupation with the voice of the ozarks which is a misnomer at best. and oh yes, i have remained gentlemenly in my answers to all questions both simple and complex . i have offered my help on many subjects and tried to be as nice as i possibly can. so santa old buddy the above items are what i want so that i can make the head mobile a force to be reckoned with in the new millennium and go about doing what i do best, crushing mudducks. and to think that idiot, prozac, calls himself a real person, heck that boy is still wet behind the ears and living with his parents. anyway this is your faithful believer , ice cream man and i am back quiet......ps. i am considering going big ac , santa , also , so that sort of gift would be nice also,....icm out........

Hams have to abide by a law to wait their turn to speak. Or else it'll be called "harmful or malicious interference" which is illegal, right?

Message-ID: <22839-3863EBC1-35@storefull-115.iap.bryant.webtv.net>
Source record: 16919

As per your meaning...there is nothing you can do to the unit by transmitting a 4 watt signal at a close distance from the antenna or the radio.

3471. Re: M400 VS. Sckullcracka 4 pill

If you are using the same series of battery (that is, same manufacturer), then you will be fine using a 12 and 6.

However, using different (like you are looking to do), you will find that one set (either the 12 or 6) will get overcharged due to a different internal resistance... This means that one battery type will ALWAYS be getting overcharged trying to keep the 18 volts up.

Hope that makes sense. If you use a 12 and a 6 that are the same brand and type, then it doesn't matter... You will be getting equal 2.X volts across each cell during charge.

However, with different battery types, you get different resistance(s) all in a line.

Try taking a set 5K and 10K ohm resistor and putting them in series, and then wiring this across the battery terminals.

Measure the voltage difference across each resistor.

Proof positive about this theory.

There have been a couple of versions of this devil over the years, including a Cushcraft years back. They are still made by Sirio and called Vortex or Tornado - something like that. It is basically a half-wave, elevated feed design. Its a pretty good antenna and has a low radiation angle. But.....it isn't the toughest stick around. Depending upon how you feed it, you can make an interesting dual-band antenna out of it. Unfortunately, the high-band is not particularly useful around these parts.

I'd fix 'er up and take if for a spin.

MC

Looking to buy the best antenna for my semi-truck. I would like it to be a single antenna, mounted on drivers side mirror bracket. The requirements would have to be strength, not over 6' in length, and able to handle 1000 watts, and of course it must "get out"..I really would like to get your comments so I can make a wise purchase. Thank you..."Heavy Duty"

<<Hams have to abide by a law to wait their turn to speak. Or else it'll be called "harmful or malicious interference" which is illegal, right?>>

I can say with some certainty that the threat of having one's license revoked for
harmful or malicious interference is not what compels most hams to act considerately
and wait their turn to speak or be courteous in a round table or one-on-one QSO.

As someone so aptly pointed out, "All radios are wonderful, especially with a good
friend on the other end". You can extend this include your fellow radio hobbyists,
treating them as "friends you haven't met yet" - instead of competition to be squashed.

3481. Handheld question

Load the amplifier properly, apply power from a car battery, and use an amp meter to measure the current in the supply line , take this figure and bump it up to whatever saftey margin you're comfortable with. You probably don't want to run the power supply at max output anyway.Isn't this a hell of alot easier than guessing at efficiency and peak vs average.?

Merry Xmas & Happy Holidays

This goes out to every one on this NG including Toll Free, Ice Cream Man, and even the X-force guys. I wish you all the very best and a happy New Year.

I hope you all don't forget to put your mics down and spend some quality time with your loved ones.

Special thanks to the Dave Made guys for building my Xmas present and getting me set up for the new year.

3484. Big Bob's Greatest Christmas ever

Newsgroup: rec.radio.cb
Date: 1999-12-24 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <38641B92.2285F2EA@qnet.com>
Source record: 16933

Big Bobï¿½s Greatest Christmas Ever.

Big Bob had a good family and a mother in law, he lived in a modest house and
surroundings. Big Bob was considered a ï¿½Big Strapï¿½ within the CB and local community.
Big Bobï¿½s notoriety came from the ability to work all neighbors at the same time, however in Big Bobï¿½s case his neighbors didnï¿½t seem to get to upset, they thought of hearing Big Bob come over their TVï¿½s, Toasters, and Phones as kind of a neat thing.

Big Bob worked at the Studios in Beautiful Downtown Burbank Ca, he was considered one of the best carpenters and lay out men, ever. His wife Mrs. Big Bob worked in one of the local aircraft plants, in Burbank Ca. They were a happy family, with Mrs. Big Bob usually keeping watch over her better half Big Bob. She would always say that instead of having two boys, she had three incorrigible children that would take the lead from the oldest one, Big Bob. Which was a full time job, and always wondered if she could get a remote controlled electric shock collar which would automatically go off when Big Bob got near the bar or CB Radio, or just when Big Bob was being Big Bob.

Big Bob had a nice new Chevy Truck, just before Christmas BB had brand new steel belted radial tires put on his truck. I remember the old tires and rims being placed up against the side of his house, they were 3/4 ton, eight hole, rims that would fit my truck, but the tires were really wore down. BB also had a brand new Linear Amplifier, that was the talk of the town. literally.

Well as hard times go, they visited the Big Bob family. Both Mr. & Mrs. Big Bob got laid off from their jobs. And the youngest child had doctor bills to be paid off. And Christmas was just a few weeks away. I remember hearing across the wash (about 300 FT.) Mrs. Big Bob loudly discussing the finical status to Big Bob. Well I didnï¿½t hear all the conversation, but is was obvious that Big Bob was getting chewed out.

Christmas came and I could see a big Christmas Tree decorated in the Big Bob living room window, the kids were outside running around the house with their new toys, I didnï¿½t hear Mrs. Big Bob loudly discuss anything with Big Bob, so I take it Christmas went ok for all of them. Big Bob was still a Big Strap on the local home channel, and all things seemed normal.

As we would both do, (was to spy on each other) I got out my binoculars and looked over the fence in full camouflage of a low hanging tree branch. And noticed Big Bob had sold his new steel belted radial tires,

and put back on his truck, his old set of wore out tires. But Big Bob had the greatest Christmas of all. You could hear it in his voice, and see him smile ear to ear a mile away.

The moral of this story is to sacrifice and give for your family and loved ones. But never, never sell your Linear Amplifier.

Merry Christmas , and God bless to all.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

A Good friend to Big Bob, famous CBï¿½er and flossifier.

Big Bob says ï¿½ U could be a CBï¿½er if .... U know all the people by their handle who are standing in the welfare line. And the ladies handle at the welfare window is ï¿½Welfare Claireï¿½, a nice old lady. But her 10-20 is to far away to hear your new Welfare Linear.

3485. Stacked 8 element quad antennas:

Newsgroup: rec.radio.cb
Date: 1999-12-24 00:00:00 UTC

Message-ID: <38641C9F.9F4EFFC6@qnet.com>
Source record: 16934

Stacked Eight Element Quad Antennas; or, There is no translation of
Merry Christmas to a Ten-Code Number:

Unidentified Flying Object, NORAD Reports tracking an object out of the
North. The President was notified late on December 24 that a possible
Soviet missile test was in progress, but the State Department said the
Soviets denied any missile testing. And the Defense Department just
thought it was Santa Claus.

The FCC has intercepted radio communications having to do with the Radar
Tracked object. This is a reprint from a press release given at a
Whitehouse Press Conference, telling of the intercepted radio messages.
The intercepts are as follows:

UFO: ï¿½Hay there Marry Christmas, can some one give me directions to the
Highway 12 off rampï¿½?

CB Radio Operator: ï¿½Ah Yeah, Ten-Four what is your GPS coordinates Good
Buddyï¿½.

UFO: ï¿½I think I am about 50 miles North of Seattle, and experiencing
clouds and limited visibility, GPS suffering from heavy weather
condations, go aheadï¿½.

CB Radio Operator: ï¿½Give me a ten count and Iï¿½ll swing my beams around
and verify your locationï¿½.

UFO: ï¿½Ok here goes, 1...2...3...4...5...6...7...8...9...10, howï¿½s
thatï¿½.

CB Radio Operator: ï¿½Thatï¿½s just fine,
Have you at FOUR EIGHT miles due North of Down Town Seattle,
at a altitude of twenty two thousand,
heading is ONE EIGHT TWO degrees,
fuel remaining is forty five thousand,
SWR on this channel is 1.7 to 1.
The EGT is a little higher on number 2 as compared to number 1, but
acceptable.
And you have traffic heading North at Zero Zero Zero degrees at twenty
four thousand in two minuets, be advised.
Set Altimeter to - two niner decimal nine two,
Contact Seattle International on 125.9 for massive touch and goes.
And request a new Galaxy 88 CB radio for the wifeï¿½s carï¿½.

UFO: ï¿½Yes thank you for my position update, I will update the GPS now.
Verify four eight miles north of S town, heading 182 degrees,
fuel remaining forty five thousand,

SWR 1.7 to 1,
EGT higher on number 2,
and traffic at Zero Zero Zero degrees at twenty four thousand in two minuets.
Altimeter two niner decimal niner two,
Seattle on 125.9, for touch and goes request .
A new G88 CB Radio with a modulator kit installed will be underneath the Christmas Tree this year. And thanks for fixing the roof this year.
Merry Christmas to all .....Ho Ho Ho.....ï¿½

CB Radio Operator: ï¿½Ten-4, ... ahaaa ... I mean Merry Christmas back to ya, ... milk and cookies on the mantel, Saint Nickï¿½.....

Proof Positive that CB Radio comes to the rescue when all else fails, and that beam antennas really work. Be sure to use good coax, and ground your tower.

Merry Christmas to All.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

3486. A CB Christmas Story

Newsgroup: rec.radio.cb
Date: 1999-12-24 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <38641D68.136FDE5E@qnet.com>
Source record: 16935

A CB Christmas Story.

While mobiling up in Montana out in the toolies on a Christmas Eve, I notice a light in the sky moving. I wonder who is flying at this hour in bad weather up here in no mans land? I notice the light making turns and steep dives and such. Must be a pilot who is having fun acrobating around while no one else is paying attention, Iï¿½ll bet. Pilots do that some times.

I check the FM and AM radio for a local station to keep me awake, none heard except for a fadding WLS in Chicago, and a few Mexican stations. I turn down the squelch on the CB Radio to see if anyone can be heard. No one heard on any of the SSB or AM channels from A to Z. I give a call on Channel 19 AM, ï¿½Break One-Nine, anybody out there this cold and lonesome Christmas Eve, nothing heard but staticï¿½..... I wonder if somehow my CB Antenna has fallen off the truck.

I keep on truckin, I reach for the road map to see how far a gas station is, need to have a walk around and a cup of coffee, and a little friendly conversation with anybody wouldnï¿½t hert none. The map shows 70 miles till the next bill board. Iï¿½m thinking about getting off this highway and take a longer way around from where Iï¿½m going just to talk to someone. Another call on channel 19, ï¿½Anybody out there, this is Jay mobiling for truth, justice and the American wayï¿½ ..... just static heard.

Oh yeah, I think of my favorite Country Western, Rock & Roll, and Folk music cassette tape in my jacket pocket. I put the tape in the cassette player and just as Marty Robins is heard, the tape is eaten alive by the player, and the music is stoped. I pull out the cassette, and about a 329 feet of cassette tape, how wonderful! The other tape I have is a Morse code practice tape, but Iï¿½ll listen to anything at this point in time. The cassette player eats this tape twice as fast, somehow this makes me laugh a little. I tell myself ï¿½Got to be a little nuts, or youï¿½ll go crazyï¿½ I laugh a little more watching the player eat more Morse code practice tape, until the player stops. I keep on truckin.

After an hour or so I see the aircraft lights in the sky again, only this time itï¿½s flying very low and it lands right on the highway, WOW! Itï¿½s only a mile or so up the road here, I start to speed up so I can slow down to see whatï¿½s happening here. I pull over on the side of the road, while making sure I donï¿½t sink into the snow slush, off the side of the road.

I canï¿½t believe my eyeï¿½s itï¿½s Santa Claus in a slay with eight raindeer, and the lead raindeer has a incredible bright light, looked like a bunch

of aircraft landing lights on a jeep, but only much brighter. The slay has a very long set of rains with lights and bells, and is bright red, and about six inches wide. The slay is very tall and large. I get out of the truck and walk over to the slay, the raindeer are in a nervous anxious way, looking at me with a slight over the shoulder look. Old Saint Nick is sitting there in his slay looking at a road map. He says to me as if we have known each other for life, ï¿½Hello Jay, you got the latest triple A map of this area?ï¿½ I say ï¿½Yeah itï¿½s in my truckï¿½ I get the map and hand it to Old Saint Nick. He is still studying his old road map, looks like it has coffee cup stains on it. He looks over at me and asks ï¿½Jay what are you doing out here on Christmas Eve?ï¿½ ï¿½I was asking myself that a few minuets ago alsoï¿½. Well he says ï¿½I half to make a stop over at the Tommy Jones houseï¿½, he shows me a massive hand written list, it also has coffee cup stains on it. The names that have been visited are checked marked off. Santa looks over his glasses at me and says, ï¿½You traveling along son?ï¿½ ï¿½Yeah, ... I mean yes sirï¿½ He looks back at me over his glasses again and says ï¿½I gotta go, got a lot of stops to make. Thanks for the mapï¿½ He then pours a cup of hot chocolate in a Santa Claus cup for me. ï¿½Here take this, it keeps ya warm and awakeï¿½. Merry Christmas Jayï¿½ Santa turns away from me, and hits a few switches on the console of the slay. The sound of jet engines is heard, and Santa in his slay and eight raindeer take off like a rocket. Rudolfï¿½s nose gets even brighter, the sound of bells and Santa calling out Merry Christmas, is heard from above. Wow jet engine assisted take off with raindeer. I stand there in awe, now realizing just how hot the cup of hot chocolate is, radiating heat, and the steam running off the top of the cup.

I walk back to the truck, careful not to spill my Santa Claus hot chocolate, in my Santa Claus coffee cup. I get back on the road again. I turn up the CB and hear a local station call out ï¿½Whatï¿½s all that noise?ï¿½. I reply ï¿½itï¿½s Santa Clausï¿½. I know this local CB station thinks his talking to a nutsoid CBï¿½er loose out on the high way. But I talk to this local CB station for 20 miles, I enjoy the radio company. He tells me of a Ma & Pa coffee shop down the road a ways, about 30 miles away.....

I remember asking my Dad when I was around 4 or 5 years old, ï¿½How did Santa leave toys and presents at all the houses in the worldï¿½ Dad replied ï¿½Well son he uses a Jet, now a daysï¿½ Makes perfect sense, now. But how did Dad know that ????

Merry Christmas and a Happy New Year to all.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

A good friend to Big Bob, famous CBï¿½er and flossifier. Big Bob says ï¿½If ya believe in Santa Claus ya get more CB Radio presentsï¿½

well , well , well . so now the truth is out. old prozac is a college student living with his mommie and daddy and (oh please spare me) , paying rent on his room and his room is bigger than my house. boy , you do not have any idea of what you are talking about and that i can most readily assure you. gee, prozac, i thought you said you owned a machine shop. wait a minute here. you know it just didn't add up. i just couldn't figure where this boy was getting the money to buy all this radio stuff, so i figured he had an absence of something called 'bills' in his life, to allow him this discretionary income in which to purchase gobs of radio equipment. i wonder where he gets the money to do this,.....hmmmmm? i guess his daddy allows him some college expense money, he, he.... he says he is a college student. man i tell you this. i do know what college you are going to my fine feathered friend , but for a college student to be unable to use simple english composition is in a word amazing. this college should be ashamed for a number of reasons, not the least of which , allowing you to matriculate into their midst. so you moved quickly to get a 32 pill . now having accomplished this feat of daring. what is next? i can just see it now. old prozac going down the highway dropping the maul on mudducks while on his way to class (and he is late of course). geez, i guess the professor was right about one thing, most of the people on here don't have any money and damn sure don't work for a living. why am i not surprised? this is cb radio and it has been this way for a long time. so prozac, old ice cream cone as you call me has one thing to say to you. if you were my son, your ass would have been out the door when you were eighteen and i would have said to you 'bye'. and if you wanted to buy cb radio equipment, you can do so if you got the money, it is your business. i really think in all honesty that you are wasting your time in college. you need to get your lazy ass to work,.....icm out.....

I don't know where you dug up the "definition" that you did, but i remember Dennis # 12 talking about that before. I remember him stating that he thought it was bunk also, even if it was the "book" definition.

How can anyone with common sense not think that the "peak" power is what is measured AT THE PEAK of the waveform ??? Are "peaks" of mountains located on the side of them ???

Now i know why all the great minds thought the Earth was flat.... Sean
>

tnom@mucks.net wrote in message ...

>>You are wrong here. The definition of peak power is the RMS power
>>measured at the peak of the modulation envelope.Not the instantaneous
>>power measured at the peak of the RF sine wave. Since there is no
>>modulation envelope in a carrier then there is no increase in the
>>measurement. They are the same.

Snip

>Whether or not the definition you listed is correct or not is the question
>in the first place. Just because it is what is "accepted" does not make it
>correct. Sean

snip

If it's accepted then it is supposed to be used. This will keep everyone talking apples when apples are discussed and oranges when oranges are discussed. If a 100 watt carrier is 200 watts peak (according to you) then you'd better find a new term to describe this type of wattage. PeaK is ALLREADY taken. Try 200 watts instantaneous.

Believe me, i am far from being God of anything. In terms of electronics, RF and this newsgroup, there are people reading these posts that i can't hold a candle to in terms of book knowledge and understanding of physics. I am self taught and have a large gap in my education when it comes to specific areas of electronics. I simply share my experiences with you folks and hope that it can benefit others. There have been many people and posts made on this group that i have learned from. Thanks to those that have taken the time to teach us what they learned long ago.

I used to think i knew a whole bunch about everything in life. As you get older, you realize you know very little. I have been blessed to have several mentors and friends that put up with me and have helped me to understand the little bit that i do know. I'm sorry if i came across as speaking derogatorily towards you. I guess i was a little over-enthusiastic in my agreement with Dave's comments. I did include the little pun about "swing is a local thing", so i hope you can see that i was NOT trying to belittle you or your ideas. I used to think the same thing more than a few years ago.

I hope all of you folks have a good Holiday (Holy-Day) and are warm and healthy. May God bless all the RF junkies everywhere !!! Sean

||>
||
||There's a old saying: There's no such thing as a free lunch, and it
||applies in this case as well.
||
||Your test scenario is all well and good, and I agree with the results
||that you will see. Now, repeat the test at about 8 or 10 miles out, and
||see what happens. While your peak modulation power will be the same, the
||carrier power with the swing kit will be less, resulting in a weaker
||signal level than the radio with the full 4 watts. During periods of
||"lesser" modulation, your signal, with the swing kit, will be subject to
||interference from other stations with slightly stronger carrier levels.
||
||While is is true that your modulation is what carries the intelligence
||in your transmission, the carrier is what quiets the receiver, and
||blocks out background noise.
||
||I've listened to "swingers" in the distance, and they are usually much
||harder to copy than someone with minimal or no swing. The rapid changes
||in signal cause the receiver's AGC to have fits trying to keep up with

||the wildly changing signal levels. Many of these people also, for
||whatever reason, get distorted by the noise blanker of the receiver (I
||have to turn it off to understand them clearly). I don't know if this is
||a result of excesive swing itself, or distortion products that are
||introduced as a byproduct of the negative cutoff, or just a badly tuned
||amplifier.

wrote:

>I don't know where you dug up the "definition" that you did, but i remember
>Dennis # 12 talking about that before. I remember him stating that he
>thought it was bunk also, even if it was the "book" definition.

That's what he said. Then i told him he'd better write his own book.
He was the only one who had a different definition of what peak power
is. Now i see you have this same definition. I think you believe that
a 100 watt carrier is also 200 watts peak. Correct me if that last
sentence is not your belief.

The widely accepted definition of peak power is all over the place. It
is one of the most BASIC definitions regarding basic RF theory.

>How can anyone with common sense not think that the "peak" power is what is
>measured AT THE PEAK of the waveform ???

Not every truth in this world makes common sense.

>Are "peaks" of mountains located on the side of them ???

In this case yes. Read on.

Peak in this case has NOTHING to do with a peak voltage power
formula. Peak as used in the term "Peak Power" means the average
power contained in the peak of the modulation envelope. Not the power
contained at the peak of the voltage of the RF wave form.

In other words the average power measured at the crest of the
modulation envelope, or crest power.This dual use of the word peak is
what causes the confusion. Peak, as used in RF power measurements
means power within the peaks (modulation peaks), not power measured at
a voltage peak.

ALL wattmeters, I said ALL wattmeters that can measure a peak wattage
and a average wattage will show a carrier signal to be the same
numerical value. If any wattmeter manufacturer went by your definition
of what peak power is then they would show a 100 watt carrier to be
200 watts peak. They do NOT.

I told Dennis to write his own book. He hasn't as far as i know. By
the sound of it you may have gone even further. Have you recalibrated
your own wattmeter to a new definition of power, before the book was
even written?

I am not trying to flame. It is just that your belief of what peak power is goes against every definition, and every manufacturer wattmeter calibration that exist.

3500. CB idiot needs help...

Hi, everybody! I don't know alot about CB radios, although I use them quite often when I'm four wheeling in order to stay in contact with my friends. I would like to get a nice CB setup without spending a ridiculous amount of money. I'll be using it about 2 days out of the month, and I'm mainly looking for something with decent range, but more importantly reliability and nice, clear sound. Right now I'm using a low end Cobra unit with a cheap Radio Shack antenna that gives me nothing but problems. I've tuned it with an SWR meter, but that didn't help too much. I'm considering a high end Cobra and a K-40 or Firestick antenna. Any suggestions? Also, what are the true benifits of dual antennas? Is a power mic a good upgrade? And finally, are there any good online sources for buying my new equiptment? Any suggestions for components or complete systems are welcome, as I really don't know which brands are good and which ones suck. Thanks for any help!

I use a Wilson 5000 and it works just fine for me, but It's not exactly for someone not wanting to spend a lot of money on a system.

My radio is an old Cobra 29 LTD Classic with a ton of mods. One of which was called a "Super Trucker Fucker", which only seemed to make things worse so I had it removed. I also have a 225 watt linear.

Any suggestions? Also, what are
>the true benifits of dual antennas?

My local radio man says "Nothing". He says a single antenna with a single coax is the best way to go.

Is a power mic a good upgrade? And

5/8 wave vertical for CB, sounds like a good one. Just stretch the antenna a foot or so to make up for the loss of the capacitance hat wires. You should get a bandwidth of about 1.5 to 2 mhz out of it, and good gain too. Full size all metal 5/8 wave verticals with full size ground planes are pretty hard to come by in todays market. Well worth saving! I use one here just like it ---up 75 feet, talks 75 miles on 25 watts SSB easily, 100 miles on a good night. I use mine on 10 meters too with no retuning necessary---have made many many S 9 overseas contacts with it. Hold on to that one!

The emphasis was on ham, since Ernie challenged us to give out names and call signs. A few of them, however, were CBers, including ole "Rabbit Ears" down in JAX, Andy's in Houston, etc.

>Just for your info. I have not have a CB hooked up since
>1995.

10-4. Well, maybe we'll run across you one of these days, especially if you throw the rig in your vehicle for a trip south........

Well, Mr. EasyRider. Welcome to the group, I guess. You must have missed the requests from one of the CB participants in the NG--he wanted names and call signs, and we obliged.

I see you have an identity crisis. EasyRider? 7500AMP@LinearHq? CBRambo? CBRambo? Now where have we heard THAT name before? You want us to believe that you are the late, great CBRambo? No way, Jose!

Merry Christmas, anyway....

>""Anyone know of a good objective
>> > comparison between the 2970 and the 6900? I would like to know
>which is..."
The TR-6900 is a "CB style" 10M radio with the 40ch 10kc "channel dial" ect, while the 2970 has the full lcd freq display w/ split freq capability & 1kc resolution. However , The 6900 uses the "newer 69XX series "board" which in many opinions is more stable & better overall than the board in the 2970....So if they bolted the "faceplate & controls" of the 2970 on the body of the 6900 THAt would be the radio to choose!! (I suspect that they may have already done this on the new 2970DX--haven't opened one yet)

LOL ICM Let me tell you a few things. I own A 1999 Ford Touras, A 1980 Fire Bird, (both insured)Two 1990 RM 125 Dirt Bikes, a 25 foot walk around trophy with a 5.0 Merc cruiser, School bills, A $40.00 a month internet connection, A cell phone, rent, I spend more in a month on bills then I bet you even make.

The money I spend on my CB stuff is play money.

When I finish school I will be spending double what I do now and you will still be asking Santa for an amplifier.

What where you doing when you were 22?
Working at Mc. Donald's or driving a truck?

I thought you where cool when I first started coming here then I realized you had nothing to say but little pouts about what other people say.

"ice cream man" <pinhead_16@hotmail.com> wrote in message news:8419o0puv1@news.smartworld.net...
| well , well , well . so now the truth is out. old prozac is a college
| student living with his mommie and daddy and (oh please spare me) , paying
| rent on his room and his room is bigger than my house. boy , you do not have
| any idea of what you are talking about and that i can most readily assure
| you. gee, prozac, i thought you said you owned a machine shop. wait a
| minute here. you know it just didn't add up. i just couldn't figure where
| this boy was getting the money to buy all this radio stuff, so i figured he
| had an absence of something called 'bills' in his life, to allow him this
| discretionary income in which to purchase gobs of radio equipment. i wonder
| where he gets the money to do this,.....hmmmmm? i guess his daddy allows
| him some college expense money, he, he.... he says he is a college student.
| man i tell you this. i do know what college you are going to my fine
| feathered friend , but for a college student to be unable to use simple
| english composition is in a word amazing. this college should be ashamed for
| a number of reasons, not the least of which , allowing you to matriculate
| into their midst. so you moved quickly to get a 32 pill . now having
| accomplished this feat of daring. what is next? i can just see it now. old
| prozac going down the highway dropping the maul on mudducks while on his way

| to class (and he is late of course). geez, i guess the professor was
right
| about one thing, most of the people on here don't have any money and damn
| sure don't work for a living. why am i not surprised? this is cb radio and
| it has been this way for a long time. so prozac, old ice cream cone as you
| call me has one thing to say to you. if you were my son, your ass would
have
| been out the door when you were eighteen and i would have said to you
'bye'.
| and if you wanted to buy cb radio equipment, you can do so if you got the
| money, it is your business. i really think in all honesty that you are
| wasting your time in college. you need to get your lazy ass to
work,.....icm
| out.....

HI fellow cb er's.
I have aquired a commercial antenna that I got of a roof top this summer. Its very old. Possibly from the early 80's. The dipole is about 22 or so feet tall and the 4 ground radials are 8 feet long. It is all aluminum and it used to have these very small radials that screwed into the very tip top of the dipole but its not there now. I imagine it was for tuning of some sort. Anyway does anyone have any ideas. The suspense is killing me.

Merry Christmas all

Believe it or not, Motorola did stop production on the MRF 477's and 497's about 2 1/2 years ago. They are still available, but the price has pretty much tripled from what they were formerly available at. Once the supply runs out, they may be gone forever. Motorola would have to get a pretty massive order to even remotely think about producing them again. Sean

Heavy Duty, what type of radio are you using ? This has to do with what type of bandwidth we need to cover (the amount of channels with a reasonable swr) ?? We also need to know if your hauling boxes, tanker or flatbed ? It would also be good to know what make and model of truck it's going on. Are you talking 1000 watts of peak modulated power or 1000 watts of average power ?

What is a good antenna on one specific installation may not work well on a different type of vehicle or mounting location. The more info we can get, the more of an educated answer we can give. Sean

Looking to buy the best antenna for my semi-truck. I would like it to be a single antenna, mounted on drivers side mirror bracket. The requirements would have to be strength, not over 6' in length, and able to handle 1000 watts, and of course it must "get out"..I really would like to get your comments so I can make a wise purchase. Thank you..."Heavy Duty"

My problem is not with you, so please don't take it that way. It is with how they arrived at the conclusion of what is peak and what is not.

If you slow down your scope, a carrier at any frequency is a series of sine waves. Like any other sine wave, it will have an average power rating and a peak output (the power at the top of the crest) also. Your analogy or "definition" says that the peak and the average in this case is exactly the same. If this was true, it would not be a sine wave at all.

It is this type of incorrect thinking that DOES NOT allow the Bird 43P to accurately display the correct 4:1 peak to average ratio on a 100% modulated waveform. How can you calibrate a peak detector to show the same power as what the average circuit is showing ? Peak and Average power ARE different things. Since the reference voltage has remained the same during the calibration procedure, the peak reader is always reading low or short of what it should be. They are TWO DIFFERENT MEASUREMENTS yet they are being treated as one.

While i have NOT tried this, i am pretty sure that if the carrier level on the peak reader was adjusted to show the correct higher reading instead of calibrating it for the same reading as average, our 4:1 peak ratio would probably read correctly (or at least much closer). I may have to do this just to see what happens. Sean

>thought it was bunk also, even if it was the "book" definition.

That's what he said. Then i told him he'd better write his own book.
He was the only one who had a different definition of what peak power
is. Now i see you have this same definition. I think you believe that
a 100 watt carrier is also 200 watts peak. Correct me if that last
sentence is not your belief.

The widely accepted definition of peak power is all over the place. It
is one of the most BASIC definitions regarding basic RF theory.

>How can anyone with common sense not think that the "peak" power is what is
>measured AT THE PEAK of the waveform ???

Not every truth in this world makes common sense.

>Are "peaks" of mountains located on the side of them ???

In this case yes. Read on.

Peak in this case has NOTHING to do with a peak voltage power formula. Peak as used in the term "Peak Power" means the average power contained in the peak of the modulation envelope. Not the power contained at the peak of the voltage of the RF wave form.

In other words the average power measured at the crest of the modulation envelope, or crest power.This dual use of the word peak is what causes the confusion. Peak, as used in RF power measurements means power within the peaks (modulation peaks), not power measured at a voltage peak.

ALL wattmeters, I said ALL wattmeters that can measure a peak wattage and a average wattage will show a carrier signal to be the same numerical value. If any wattmeter manufacturer went by your definition of what peak power is then they would show a 100 watt carrier to be 200 watts peak. They do NOT.

I told Dennis to write his own book. He hasn't as far as i know. By the sound of it you may have gone even further. Have you recalibrated your own wattmeter to a new definition of power, before the book was even written?

I am not trying to flame. It is just that your belief of what peak power is goes against every definition, and every manufacturer wattmeter calibration that exist.

Hello. I'm pretty sure that you are talking about a Penetrator 500 from the 70's made by Hy-Gain. The exact measurements should be 22' 6" long, and the radials should be 8' 9" long. The four top radials are 10" long at 45 degrees angle down. I had one of those back in the 70's and I still have another one right now.It is a 5/8 ~ antenna. They used to be the best of the best back then.

Ok, I have the answer. Lets just all un hook our radios and boxes,bury them in the back yard and run for cover! The hamops have the FCC in every town!!!! LOL "whatever".
Oh yeah, let me see, Lets say the local goverment "cops etc..." get the enforcement deal, you wont have to worry about getting a speeding ticket around here for a few days!! WHY? 90% of them"the cops" will be in jail!!! WHY?? They are running export radios in there units" Its kind funny when the local cop pulls you over for speeding and spots your radio and asks where he can get one for himself!!!! But anyway im not worried about a thing im not a "big boy" and just like to talk a little dx.So to all you Hamops on this CB newsgroup why not be the "professional and outstanding" operators that most of you claim to be and go hit a repeter or somthing.Its nice to have "some" of you guys around here for the tech help but we dont need all the BS. I thought thats why most of you went ham, To get away from the BS on CB.So why hang with us? "the low life cbers"
"by a low life no good cber.BOX 223"

It is not my analogy. It is not my decision of what definition is
what. This definition is older than I am. The peak power is the
average power. Only the time period of measurement changes. Peak
power IS a measurement of average power!!!! Taken from one cycle,
during a peak of the modulation envelope.

Peak does not mean the peak of a sine wave. Peak is used to denote a
time period for a measurement. (Take a measurement during a modulation
peak, not valley) = PEAK POWER

>It is this type of incorrect thinking that DOES NOT allow the Bird 43P to
>accurately display the correct 4:1 peak to average ratio on a 100% modulated
>waveform.

With a proper waveform it will. Download the Bird catalog and read it
yourself. Page 63.

http://www.bird-electronic.com/html/pdffile/doc2.pdf

>How can you calibrate a peak detector to show the same power as
>what the average circuit is showing ? Peak and Average power ARE different
>things.

Again, no they are not. Only the specific time period for measurement
changes.

Peak power measurement for a carrier =
If you measure a carrier the modulation peak is constant, (no peaks)
so that any cycle of the RF will contain the same power as the average
power.

Peak power measurement for modulation =
If you measured a proper 100% sine wave modulated AM signal a RF cycle
would be chosen at a modulation peak. The RMS voltage on this peak
will be twice the amplitude of the RMS voltage on the original

carrier. Therefore the Peak power is four times the original.

What you need to understand is this:

(THE RMS VOLTAGE ON THE PEAK)
If you can understand what that means then you can

understand what peak power is.

John, there is no set amount of time to talk on ham radio. You have
to ID every few minutes, but you can talk all night if you want
(assuming anybody will listen to you that long).

As for the callsign (serial number??), if you're not doing anything
wrong on the radio than you have nothing to fear by making your identity known.

And finally, nobody has to listen to anybody on ham radio. If you
don't like anything that is being said, there are a huge number of other
freqencies to try.

The best deal on the low price range market right now is the Uniden PC 122XL. For about $109, you get a AM/SSB radio with fair feature set and solid performance.

If you can afford more, than consider something like the Uniden Grant. Of course, any of the Cobra radios are fine also.

> I'm considering a high end Cobra and a K-40
> or Firestick antenna. Any suggestions?

Both of these are popular antennas. Also consider the Wilson models.

> Also, what are the true benifits of dual
> antennas?

In a typical passenger vehicle situation, very little. On a large truck, dual antennas are used to increase the signal strength directly in front of and behind the truck. Since the trucker mainly wants to talk to other truckers on the same road, and not normally talk to others off the highway, this increased directional aspect is desired.

However, most passenger vehicles are not wide enough to place the dual antennas far enough apart to get the directional effect, so there is very little benefit.

> Is a power mic a good upgrade?

If operated properly (not overdone), this can help to add a little more punch to your voice.

MC,

> If you held
>a gun to my head and told me to design and build a FET RF amplifier, I
>would plead that it be FM or CW only.
Most all AM broadcast transmitter manufactures now used FET's in the
output. Just stack those modules man:-)

I agree not for the faint hearted. My engineer has our 2 x IRFP450's
still sitting on the bench, one month on, producing 750w into the
Termaline at 92% efficiency. PDM modulator is also now up and running.

I'll post the complete circuit after we have interfaced the modulator
with the output stage. Our unit will be used as a low power AM broadcast
transmitter for the low power licences available here in the UK.

There are FET's out there that work at 27Mhz. People are afraid of
getting their feet wet. They're all waiting for somebody else to go
first.

Also, I'm sure people would cry foul if you tried these at a shoot out.

Our FET's are 5 bucks a piece!

Phil / UK

Check this site if you want to build an amp with a MOSFET (MRF154). It will cost you about $1200 to build one but the amp will do 1000W easily and at low current drain.

If you look closely to the specs the rating says xx watts
PEP... meaning peak envelope power... not RMS or any thing
thing else. The measurement is from +crest to -crest in AM,
and in SSB that is from 0 to max of 100% modulation. At say
110% modulation the 10% gets clipped. The lack of carrier is
irrelevant in SSB power measurement.
Marry Christmas.

Running 2 12's would give same results, but your are stuck with a pretty high voltage. If an amp is trully operating correctly and producing the maximum allowable gain from the transistors, you will see a lot of blown transistor when running the higher volts (above 20), even more so when running any kind of deadkey.

At 13.8 volts with a good set of power meters you should see between 300 and 350, some TS 350's will produce a little more, a lot has to do with the amount of drive applied to the amp.

The absolute best way to look at measuring SWR (or using an antenna analyzer or noise bridge) is to do it directly at the mount.

I got into an argument the other day where a guy was trying to tell me that the MFJ lied with multiple antennas because he was seeing a measurement that was off the chart (like 5 ohms with 40+ ohms of positive (inductive) reactance), but his SWR meter was "right on" because it was 1 to 1.

Couldn't explain it to him, other than telling him to run about 10 grand into that 213 and see how well it held up.

Unfortunately for him, he doesn't have but a 4 pill.... Guess he won't hurt it.

Some people just can't learn, though... Those are the same ones who believe that you have to have a battery mounted in every corner of your vehicle because if you don't, the side with the battery will pull the signal out that direction!

No, they do look like a bastards conglomeration inside, but that is actually a benifit to them... The rats nest means that they will not (or helps to deter) go into self oscillation.

Kind of like the copper boards that the big builders are running.... No good RF Engineer would use them, but they work, and they actually help (with all the capacitance) to keep the amps stable.

Here is the explanation for the behavior of some amateurs that you are
talking about:

There type are intimidated and made to feel inferior by CBer's,
whom they, although maybe subconsciously, feel are superior to them.
Therefore, they re-direct there inferior feelings to a self-dilusional
dislike for the person/people whom they actually admire and want to
emulate.

This also explains there presence on this newsgroup when they
constantly have nothing constructive to say.

If your looking for an SSB radio that can easily be mod'ed with good output and the potential for even more, look to the Texas Ranger TR-696 or the TR-696F if you have the extra cash. The only difference is cosmetics and the F includes a freq counter, which would come in handy once the radio has been "freq'ed". Don't confuse the 696's with the TR-296, as that radio is strictly a 148 clone.

While the Uniden Grant XL is a very viable alternative, the Texas Ranger will do more power after simple modifications, offers better sensitivity long distance ears) and will cover a wider frequency range after being "freq'ed". The Uniden Grant XL also has a problem with the factory AM power regulator going out, which could give you headaches down the road.

The TR's also make it easy to install a dual final kit for even greater power and have factory provided jacks to easily install a Connex board should you desire one). Should you want to install a "channel kit" instead of having someone modify the PLL circuit, the Viagra kits are pretty much a straight drop in. Using this method will let you choose bands and follow frequencies with a Galaxy and most other export radios channel for channel.

The Galaxy DX-949 and DX-959 radios use the same chassis and offer very similar performance. While the Galaxy's are more money, they also offer more features. Whether you like or want those specific features is a matter of personal taste. Keep in mind that the Galaxy's do come with a 2 year warranty, which offers some peace of mind when shelling out a couple hundred dollars for a piece of gear. Sean
>

Anna wrote in message
Hi

I had asked the original question about the 148's.

What radio would you reccomend then forgetting about the cobras... One that can still be frequed and tuned? How about withinn the $150-$200 range?

I still have time to decide on the radio as I won't be able to get one until after the new year.

Thank you
Anna

I have found the MFJ's to work well for what they are. As you know Toll, we dialed in Bobby T's 5 antenna array in Memphis using an MFJ-259 and had great results. He stated that his reflected meter "did not move" until the rear antenna burst into flames at appr. 40,000 watts RMS !!! I think that we pretty well had her dialed in, especially given the amount of time and conditions that we had to work with.

Then again, i have seen multiple antenna arrays or antenna installations with nearfield reflections give analyzer's fits (probably rightfully so !!!) The more complex the installation, the more error that you'll see them develop. Like any other tool, you have to know how to use it to obtain the best results possible. For most people, the newer style MFJ is TOO much information.

As to the batteries acting as the counterpoise, that's about as goofy as the idiots driving around with a ground wire stuck in a bucket of "salt water" !!! Sean

Not exactly. Some ducks whistle, while others live in trees

> the listed frequencies are not the most vile of all frequencies then
> i don't know what is.

FRS is vile??? I hardly hear any traffic there.

> FRS = foul radio station

Are you confusing FRS with CB and the unrelated freeband by chance?

3583. Re: Best Mobile Antenna For Semi-Truck?

Newsgroup: rec.radio.cb
Date: 1999-12-25 00:00:00 UTC
From: redhicks@aol.comnojunk
Message-ID: <19991225090334.24962.00001567@ng-fc1.aol.com>
Source record: 17051

The biggest antenna you can get. The big coils seem to work the best. Look for maintainability. While you are out. Use stainless steal stud, and mount for the least amount of worry.

Our shop prefers the Nug-a-Tron. All aluminum. Check the stinger size to ensure that the thing can be replaced easily. Will it accept a Wilson stinger or a K40 stinger that are usually available at most shops. Or do you have to go to that specific shop to buy parts.

The antenna will make up 80 percent of your communications equipment. Handle a 1000 watts. Well then you must be running some high dollar stuff. Broad banded is important I would guess. Though Wilson antenna's are very well built and maintainable, they for a norm are not broad banded. Maybe (by themselves) they will be a band up and band down. Normally, these top out on SWR past them. Sometimes, depending on the truck, they only get 1/2 up and 40 down or visa versa. There will be those who argue with me on this but I install these antenna's on ALL trucks and have seen this to be very true without external help. Antenna matcher.

I have found the opposite is true with the larger coiled antenna's such as the Nug-a-tron. As a norm this antenna and those like it will tune very broad banded. 25 to 28 usually. Sometimes this is not the case. But again it depends on the vehicle.

These long antenna's are not very practicle unless you want to put up with it on cab over's. They are very tall antenna's and on a conventional truck need to be mounted usually at a 45 degree angle. This is for the Nug-a-Tron. Sometimes we can stand it up and be ok. But instead of curb feelers, you now have bridge feelers.

The only rule here is to buy an antenna that is maintainable, suits your purpose and remember that the larger the surface area you have to send and receive from the
happier you will be. Now your limitations are the vehicle and your pocket book. Spend wisely at first and be happy for a very long time.

It is true with everything. It cost a little more to go first class, but the return is well worth it in the long run.

Happy Holidays and God Bless.

Hello Racerx: Good advice from VE7SEZ & Zsanabria, on the replies on rec.radio.cb

The only antenna I know that had 4 top hat radials was the famous Hy-Gain Penetrator 500. And that's right about the top hat radials being 10 inches long, measured from the end of the tip, to the center of the mounting screw. The screw is a 10-32 x 1 1/2 inch long. The top element is 7/16 outside diameter (OD) aluminum tubing with a crimped in 10-32 nut in the end.

There where 4 to 5 models of the Penetrator 500 made by Hy-Gain. If the ground radial (7/8 OD aluminum tubing, 24 inches long) has two holes at one end, then this a modern 5/8 antenna, well worth cleaning up and using. Be careful with the tuning wires they are brittle, they break very easily at the bottom connections, but can be replaced with 12 gauge tinned bare copper wire.

Let me have your US mailing address, and I'll send ya a copy of the assembly instructions and some tips on improvements.

Jay in the Mojave

>and at low current drain.
>
>http://www.communication-concepts.com/ar347.htm
CCI just push out the Motorola designed app note boards and kit of
parts. No switching, no bias no nothing. You have to be an amp designer
to put their kits together.

Start with a Skywalker (do a search) kit if you want a complete amp kit
which is strait forward to build though not FET based.

Regarding the 154's above.

You're in the wrong FET camp.

Go look at the caltec site plus the International Rectifier site for the
FET's.

Forget about the 154's.

Phil / UK

First af all I an NOT a HAM... BUT if the CB'ers would pay
wore attention on their mods and properly tune their whole
system, and quit talking across town on 1000 watts
especially when skip is running maybe we would not have the
hams on our ass. I can hear guys talking across town and
bragging on the 1000 watt liner they have and the power mike
with the modulation limiter clipped and splattering 6
channels up and down from the one they are on, up here in
Canada!

Ignorance like this needs their ass kicked, but that makes
the rest of us look bad too!:-(((

>took that MFR477 final , why was production ceased , I notice that most CB
>shops dont have any problem at all finding them for about $45, quite
>overpriced when you look at the price most other transistors go for ??????

Ok. My partner there answered this for you. (thanks) They are out of production. There was about 200 of them that came in about, what 2 years ago and our suppliers called all of us and offered us a limited amount. Those that wanted them bought them. And they cost us a lot of money.

I don't know how many radio's where built with that final. To be honest most CB radio's don't have those finals in them. They use a 2sc1969 (13 watt output) or a 2sc1078(5 watt output). Even the Galaxy radio's use the 2sc1969 final in them. Those aren't CB's though.

The answer to the first question though is I don't know why they stopped production on them. There is a replacement final you have to do some creative switching. These are found in your High end Export radio's.

Hope this helps all who are trying to make a wise buying decision on a radio.

If I understand that when you say +crest to -crest you mean
a peak to peak voltage then you are wrong. If you used
a formula to measure SSB PEP it would be:
2
PEP = PEV / Z

PEV = the rms voltage taken at the Peak of the Envelope

A little hint: There is a special division of HAMops that are FCC Aux.
and are enpowered by Congress and FCC to observe and gather evidence
ONLY ON AMATEUR BANDS,
so CB is NOT covered. Congress also authorized a CB monitor service but
there is no National CB group to volunteer.

> Oh yeah, let me see, Lets say the local goverment "cops etc..." get the

> pulls you over for speeding and spots your radio and asks where he can get one
> for himself!!!!

Some of our sheriff's and State Troopers were running export/ham
modified rigs until
they stopped an FCC enforcement officer out of New Orleans Office. The
Local LEO was talking on the radio to his buddy up the road while
writing out the ticket but didn't know the gentleman next to him was
observing everthing and didn't say a word. Not knowing that he had an
FCC enforcement officer, he continued to make his conversation
and finished the ticket. With that, the FCC Officer was off and went to
his car to use the Cell Phone. The FCC officer notified his office and
a Federal Marshal was dispatched to the Local LEO Office whereas Officer
Friendly was served with a violation
of Section 301 of the Communication Act of 1934 as well as throughout
inspection of his radio. Being a modified 10 meter Amateur Radio didn't
bode too well. At that, the Sheriff called in all units and told them
to get the radios out of the cars. RACES (Radio Amateur Civil Emergency
Service) for that Parish ended up with more 10 meter radios than they
could use. Basic moral-not even cops are above the law and sooner or
later, you will run upon someone who knows what the score is?

Follow up: Most Sheriff's Dept have written rules about personal radios
and that they must either be legal with Ham Lic. or FCC Certified 4
Watters.

But anyway im not worried about a thing im not a "big boy" and
> just like to talk a little dx.So to all you Hamops on this CB newsgroup why not

Source record: 17071

Merry Christmas CB Idiot: 8-)

I have just gone through this process and have settled on a system that works for me. All of the messages provided so far to your question have been really good. My experience for a GMC supercab pickup truck with a Fiberglas topper is as follows due to my desire to NOT put a hole in the roof of my cab.

Radio: Cobra 25WXST
Mic: Cobra CA77, Noise Canceling/Power Amp
Antenna: 102" steel whip mounted to the driver side rear bumper.
Coax: The best you can find. Do not skimp on this item.
External Speaker: Aries ASP25. This one cuts way down on those horrible high freq noises.

Unless you want to use an Echo mic (not recommended by me), stay away from TalkBack as a mod to your radio. My Cobra has been tuned so it is putting out much nicer than it did from the factory.

If you do not want to do the long steel whip approach, any one of the Wilson 5000 antennas are super. Of course the roof mounted will give you the best performance, but the mag mount has proven to be really good as well.

Again, this is my own solution. There are others out there that work as well or maybe better than mine, but I am happy with what I have at this point. Therefore, you are ultimately the one that will have to live with your decision. Hope this has been helpful.

Sean, I guess I didn't think about giving all the information..I own a 1999 Volvo with Stainless Steel Mirror brackets, not the plastic ones you see now..I have a under the cab exhaust due to the freight I haul, (jet engines on a deck trailer 80% of the time), and a 48' box the other 20%.
I run a Galaxy 44 with a Davemade amp keying around 400, swinging to 900 watts...I have a stainless mirror bracket, 18' of RG-213/U coax, and 50' of 8ga. stranded ground wire sitting here waiting for my antenna purchase..OH,and I run a 6' jumper between the radio and the box.
I hope you can give me some info on decent choices for my set-up..Merry Christmas!!!!

3606. FRS Terrorism on Christmas Morning

Newsgroup: rec.radio.cb
Date: 1999-12-25 00:00:00 UTC
From: rfenforcer@aol.com
Message-ID: <19991225122326.20436.00002043@nso-bh.aol.com>
Source record: 17074

Got up this morning and tuned the scanner to my bank of FRS frequencies. Since FRS radios have become the modern-day "walkie-talkies", I guessed plenty of kids would find them in their stockings come Christmas morning. My hunch was correct: several channels were active by 0900 hours, especially Channel 1.

After monitoring the action for about an hour, my attention focused on one particular conversation. A father was attempting to talk to his son on their new FRS radios, but was being maliciously interferred with by another adult. The second adult let loose with a tirade of obscenities, profanities, and threats which he directed towards the child. Upon hearing this, the child's father confronted this "radio terrorist" with a few choice words of his own. Within seconds, a free-for-all ensued, with the two adults threatening each other repeatedly and using language that would make a Mafia hit-man blush. This continued for several minutes. Wonderful! Looks like FRS gives us CB Channel 19 all over again, only this time the abuse is directed towards small children and on Christmas Day.

Just another example of how much we have deteoriated as a society here in America. After hearing crap like this, I almost hope the doomsdayers are correct in their predictions that the world will end one week from today.

I am currently using a Solarcon IMAX 2000 antenna for my base station. I have been seeing some indication from reading information here and there that static buildup in the antenna could cause some receiver noise. Is this true? Am I saying it right? If True, what is the best way to get rid of the static? My antenna is atop of 25 feet of steel antenna mast that has been fitted with a grounding rod 5/8" Dia solid copper driven into the ground some 8' which I thought would take care of any static electricity that may accumulate in or on the antenna.

>Does anybody know of a way to increase modulation or increase only slightly
>the wattage a Uniden Pro340XL hand held? Thank you.

Increasing the wattage slightly (from 5-7 watts) would probably be enough
to fry the transciever's final. Even doubling the power will make such a
little difference on the listener's end as to be undetectable.

Instead of spending money on a Handheld, which has a horrid reciever in it
(non-selective... gets "washed" by any adjacent channel activity), buy a
mobile rig (spend some decent bucks)

You can hear these tirades almost daily on the amateur bands. As a
matter of fact they exist practically everywhere. They are not just a
byproduct of CB.

Radio nuts & wackos are everywhere. It's
a reflection of society. There is a group of nuts
on the ham bands called BARF/Stumpjumpers
which has been maliciously interfering &
terrorizing other ham ops for years. I think their
headquarters is in the Virgin Islands.

Well here goes,I hooked up my m400 to my astron 70's and used a dummy load and guess what my bird read?1000 watts peak, almost 200 watts more than the previous test!!I didnt bother putting the skullcracka on the ps as I didnt want to take it back out of the truck.Bottom line,Daves boxes did the numbers!I also learned some very interesting things about different boxes and even some people on this news group.Because of what I learned I will no longer post any type of results for any type of tests I may do in the future. For whatever its worth,the gentleman from DM was EXTREMELY helpful and understood my concern as was Prime last year during the construction of my boxes.I would recommend either box depneding of course on personal preference.Thanks guys and have a merry christmas!!!!!!!

Now I did claim to have a 2 pill that does 750 average, it does between 1950 and 2000 on a 43 with a peak kit, I never said it was a run of the mill 2 pill, I cannot make two do that, just that one. It does this with a cobra 29 with the standard " tune and peak" and a variable key with the mic gain wide open and talking right into the mic. The other amps 4, 8 etc. do about as much as the other GOOD amps out there.

I also never tried to sale any amps, that is simply not what I do to make a
living, I believe that the time spent "perfecting" the whole keydown system
is really valuable on the line, That is what I enjoy doing, getting ready
and then seeing it pay off. But I would never promise numbers like that to
no one, I posted it for the hell of it, I myself did not believe it.

For 4 wheelin stay away from the K-40 as it breaks where the whip holder fits into the coil if it whips back and forth too much.A lot of jeeps run 102" whips mounted low and bent over and clipped when needed,SWR isn't hurt much with a full size whip and they are indestructable.The clips are at radio shack for about a buck,you can also get into a garage with it clipped.If you want the K-40 type try the Wilson 1000,its a little stronger mechanically.I don't think Firesticks will compare.
If your friends have SSB get a uniden grant,SSB is the biggest boost for your range.
Dual antennas can be phased for slightly more gain,usually on a vehicle this is increased gain front to back with no loss from a 1 ant setup to the sides.
I think power mikes are a waste.

Your local radio man is dead wrong,perhaps the benefits are not worth
the time,trouble,and expense to everyone but 2 antennas do have gain
over 1 and can be configured a number of ways.

Hi Phil,

> Most all AM broadcast transmitter manufactures now used FET's in the
> output. Just stack those modules man:-)

Well, 'round these parts they're all using surplus, antique equipment. Not aware of any AM stations using solid state (and friend is a station engineer). There is little money left in AM/MW broadcasting now. FM radios are pretty much standard equipment on new cars. I have AM only in my car, but that's more for nostalgic reasons. :->

> I agree not for the faint hearted. My engineer has our 2 x IRFP450's

> transmitter for the low power licences available here in the UK.

Tell me about this PDM modulator. Are you modulating the FETs a la high-level modulation using a big audio power amplifier? My original retort was based on using a pair of FETs in a push-pull, biased up, class AB linear amplifier configuration. This I've not attempted myself.

> There are FET's out there that work at 27Mhz. People are afraid of
> getting their feet wet. They're all waiting for somebody else to go
> first.

Hmmm....well, years ago some people proclaimed the death of bipolar transistors when FETs became popular. I think FETs are great for switchers, to be sure. But, it always appeared that the N channels' never had a true complimentary P channel. The RDS was always higher on the P channels, and I believe it still is. I've designed several audio amplifiers using FETs as the output devices. No problems here - in fact they often work better than a bipolar in a similar circuit.

> Also, I'm sure people would cry foul if you tried these at a shoot out.

I'm quite confident that shoot-outs have no bearing on the future of radio communications.

MC

Bond an "alpha delta"static arrester to the ground rod then run the
feedline from the antenna to the arrestor and from the arrestor to the
radio.

People are people regardless of what frequency they reside, FRS,CB, HAM, whatever. Human behavior will always be, there's nothing new under the Sun. In these so called end times we must learn how to subdue are passions and uplift mankind's conscience awareness to the level were we can make prudent, just decisions that have a positive impact on are selves end everyone around us. Ways and actions are louder than words so quit jackin your jaws about how this world sucks and start leading by example.

Ok, That's a whole different can of worms. I have to wrestle with myself over the financial side of the radio business all the time. Do I "give in" to the hype, and do something for someone simply because it will make me money, or do I give them a "mini" RF lesson and tell them why they are wasting their money by doing all of these things? Lately my conscience has been winning. There have been guys that have come to me after having their radio "done up", complaining of TVI problems etc. After explaining what needs to be done to correct the problem, they usually understand the hard lesson. Nobody wants to spend money to have something done, only to have to spend even more money to have it undone again.

I usually try to find out where they will be running their "stuff". If it's in a mobile, then I don't worry about it too much. But anyone that wants a base station "Souped up" gets a lesson in TVI complaints. Most people would rather sacrifice a little performance than have to deal with irate neighbors.

Merry Christmas!
Dave

hi there, name is Tim.i own both radios and i can say i like the TR-6900f much better, reason is the 2970 uses a micro processor and some times if you use a amp like i do.. the rf tends to scramble the processor..and some times just using the radio by it self it will scramble..and this is not a problem with only one radio, i have owned 6 of them and they all do the same....i just got the TR-6900 F jumbo, and i like it a lot better..no processor,BIG watts!180 watts PEP ssb,24.200Mhz. to 29.995Mhz. and is very stable..so i would get the 6900 with out a second thought! hope i helped Tim Holt N8VPM

Sean and Al have a legitimate shop with business license and they do get wholesale prices. They used to buy from A-1 just like many others did. Some people just don't know what we are capable of doing and they never will. We also stand behind all of the products they purchase just like many other shops and Individuals that don't have shops. Ploblem is, if you have a base radio in a room and say that you have a shop, well you go figure. If we get a copy of a tax ID like many other legit business owners have sent us, we are there to help them as well.

Hi Sean,

I was just going to ask about the Texas Ranger 696-F and the mods for channels and unlocking the clarifier. The Viagra board sounds like a good deal, but could you "expand" on this a little (I know, bad pun). How are the freq's selected after installation of this board? Also, how simple is it to install (i.e. easier than the PLL mod)? I like the 696f on account of the 6 digit frequency counter. Thanks for any help!

Paul

3653. Re: Help with Static Dissapation - Hello Bob C

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <38662624.2C05CFBD@qnet.com>
Source record: 17102

Hello No Name & Bob C:

Maybe if we ask Bob C. to give his opinion or measured results, on the Fiberglass CB Antennas he can add to a great posting he made a year or so ago. His posting was a great explanation of the static problems with fiberglass antennas .... Come in Bob C

If Bob C doesn't respond, I'll go and get the posting off my old computer.

I use to use A Shakespeare ABS-1600 5/8 Fiberglass Antenna, a significant improvement to the A99. I experienced static in the radio, it sounded like it built it self up, and then at a moment it was gone. I noticed a few times that I pulled off the the coax PL-259 connector off the radio, I received a slight static shock! You bet static build up, Big Ten-4. Glenn's (AB7RS) suggestion of a static arrester is a new one on me. I am ah gonna look into that one.

I figure a 10,000 ohm, 2 watt, carbon resistor installed at the antennas connection would bleed off the static energy, but never got a chance to try it. Maybe there's static energy on the outside of the fiberglass material, and there needs to be a slight resistive/conductive surface to pass the static energy to ground?

Hello Bob C ......

Do you make a living by doing this ? Do you warranty the parts or installation ? Are you available 8 to 12 hours and sometimes well beyond that for 5 to 6 days a week ? Do customers have easy access to coming in or contacting you ?

It takes NO overhead to do things on the side out of a bedroom or a garage. At the same time, who does someone take their radio to once the local "garage mechanic" has demolished it ? This is not to say that many radio shop's with storefronts are not also "hack shack's" that take no pride or offer any type of warranty on their work.

I am not saying that you (prozac) do this type of work, but there are many factors involved in running a business AND staying in business. There is a point that the customer does get a good deal with peace of mind and the business makes money too. Sean

prozac 625 wrote in message <4zq94.9739$mv4.416092@news.rdc1.nj.home.com>...
You have them way over priced anyway. I used to install them for less then that and I didn't even get them whole sale.

tune into a known 50 ohm load, your antenna should also be tuned for 50
ohms, when amp is installed in vehicle a minor adjustment may be necassary
to fine tune amp to the antenna system. This is how i would tune an AC box
and i would think dc is no different

Peak this in no way was meant to disparge yours, but he claimed a 64 pill holding 20 kw ands then backed it up with thaere are 2 pills out here that do 750. As you said you cannot get 2 to do the same numbers how is anyone going to get 64 to run this way.
But if you do get another to do those watts I would like to buy one even though you dont sell them, hell why wouldnt I want a 750 watt 2 pill I have never seen one that even came close.

see above post, not meant as a put down I would just like to buy one if you could make another do it. I also compete and know 750 watts would destroy the best 2 pills out there and even some 4 pills

Hey what are you guys talking about I got a battery in a 4 corners and a 20 gallon fish tank with salt water right from the Atlantic ocean and it gives me some good results .
I would use the mfj to get you close then verify the readings with a bird meter
Sean <bigfoot1@megsinet.net> wrote in message news:c3g94.1618$M56.76542@news.corecomm.net...

If you were to increase bias current would you not be reducing maximum output?
I'm thinking here in grotesque generalities.

I have the newest version of the 2950. It has a different what I call front board section. The problem is it scans as soon as you turn it on. And none of the little white buttons on the front work. Now if I key it up it will transmit but as soon as i unkey it starts scanning again. And it is stuck on the far right digit an the display. Any help would be appreciated.

Should be in the 10 meter band without the 'top hat'. Those wires are just a way to get it to resonate on a lower frequency without adding more length to the unit-----there were legal considerations at the time that caused this. If you just add a bit of length to the antenna using a wire or piece of old TV antenna tubing then you can make it work just as well without going to the trouble of refabricating the wire radials thing. I used about 16 inches of old TV antenna 3/8 inch element rod hammered into the tip of mine to get it back into shape. If you clamp the antenna into a 'workmate' in the back yard you can experiment with length/SWR till you get a good length that suits your bandwidth desired. The SWR will not change when it is put up higher. Have fun!

Hello Racer X: Got to agree with Tim VE7SEZ, just put some sort of aluminum tubing over the top section, which is 7/16 OD (outside diameter). 1/2 aluminum tubing will fit over it if you cross cut the 1/2 tubing about 1 1/2 inches, and use a hose clamp to attach it. Make 16 inches long, or there abouts. Adjust (cut in 2 inch increments) the new top tubing length until the antenna has the lowest SWR on your channel.

The top hat assemble can also be made. Use #12 gauge tinned bare copper wire, you see when you get the assembly instructions.

I'll have copies of the Penetrator 500 sent to you in a few days.

I don't know if they "know it all", but I can assure you that plans for this loop antenna have been a staple in the ARRL Antenna Book and in many editions of the Handbook for three decades. It is formed from RG-8 and a matching capacitor. It's quite easy to build and use.

Sorry to burst your bubble. We're sure you thought you had made a great discovery. Better luck next time.

By the way, if (as you say) you have not had a cb hooked up for four or five years, how come you hang out in this NG with CB *operators*. Lurking? Hoping you get enough cash or credit to buy a working radio? Troll?

America is waiting for your answer.......

No, with more bias, the gain of the transistor goes up.

However, the efficiency goes down, meaning that the final gets warmer for a given amount of power out.

However, keep the carrier low, and the average power goes WAY up on that chassis.

Toll Free

Ray, your results are typical of what others run into during typical mobile installations. Sure, yours might be different than someone else's, but that does not make them any less legit. You are working towards having the best installation and highest performing gear that you can. Believe me, you are not alone on that quest. Others here probably appreciate you taking the time to do some comparison testing in a common mobile installation.

As you know, i have posted various reviews of products from time to time. The only advantage that i have is that mine are pretty much temperature and load controlled for more consistent readings. Other than that, your results are just as valid given a similar installation in hundreds of other mobile's across the country.

My observations pertaining to loading are this: If the antenna is truly a 50 ohm (or very close) non-reactive load, the wattage readings taken on the dummy load should be about the same as what the antenna shows. This is taking into account that the voltages under load are similar. Something that varies drastically from the dummy load results means that the amp / radio is loading up very differently for one reason or another. Once you can isolate that reason and correct it, the readings should be very close either way. Sean

Well here goes,I hooked up my m400 to my astron 70's and used a dummy load and
guess what my bird read?1000 watts peak, almost 200 watts more than the previous test!!I didnt bother putting the skullcracka on the ps as I didnt want
to take it back out of the truck.Bottom line,Daves boxes did the numbers!I also
learned some very interesting things about different boxes and even some people
on this news group.Because of what I learned I will no longer post any type of
results for any type of tests I may do in the future. For whatever its worth,the gentleman from DM was EXTREMELY helpful and understood my concern as
was Prime last year during the construction of my boxes.I would recommend either box depneding of course on personal preference.Thanks guys and have a merry christmas!!!!!!!

Paul wrote in message <38659f83.52968892@news.mindspring.com>...
Hi Sean,

I was just going to ask about the Texas Ranger 696-F and the mods for
channels and unlocking the clarifier. The Viagra board sounds like a
good deal, but could you "expand" on this a little (I know, bad pun).
How are the freq's selected after installation of this board? Also,
how simple is it to install (i.e. easier than the PLL mod)? I like the
696f on account of the 6 digit frequency counter. Thanks for any help!

Paul

Every time you key up, the noise toy triggers and you hear a loud belch and someone yelling " HAY Maw..... what's fer chow ".....

Actually, any toy labled as an "identifier" is a toy that triggers when you key up. Kind of like the opposite of a beep, which goes off when you unkey. This one is a burst of multiple tones. They are all slightly different from one another, but almost sound like a radio transmitting into a repeater. Kind of like when you hear cops key up into the tower on the tv show "Cops".

NEWSLINE 1167

Newsline report number 1167 with a release date of Friday, December 24th to follow in
5-4-3-2-1.

The following is a Q-S-T. An intruder on 20 meters sets off a world-wide T-hunt. This story and more on Newsline report number 1167 coming your way right now:

(Billboard Cart Here)

**

20 Meter Intruder

An unidentified signal at the low end of twenty meters has the worlds ham radio intruder watch community on alert. Q-News Graham Kemp, V-K-4-B-B, has the details on this mysterious carrier:

Unidentified carrier on 14.001mhz and Ron Roden G4GKO, Co-ordinator IARU Region 1 monitoring service asked that the frequency of 14.001MHz be monitored for an unidentified carrier. If you can hear the signal, please take
a note of the time heard, signal strength and if possible the bearing.

Ron has received reports from national monitoring co-ordinators in several countries including Kenya, New Zealand and Canada according to the news service of the Irish Radio Transmitters Society. Any reports should be com
municated to the IRTS monitoring service coordinator in your Country.

The IARU now has a Monitoring System website and it may be found at: http://www.iarumsr1.cwc.net

-----

Once again, if you get a bearing on this mystery intruder, please report all the data you collect to the Intruder Watch coordinator in your country. Here in the United States please send that information to the American
Radio Relay League. (IARU, IRTS, Q-News)

Flood Relief in Venezuela

I'm Bill Burnett, KT4SB, in Miami with word of ham radio being activated in Venezuela where the death toll from torrential rains has already surpassed 5000 and could reach as high as 35000.

On Wednesday night, December 15th, the area of La Guaira, Venezuela, was drenched by torrential rains believed to be associated with the Pacific Ocean La Nina. La Nina is a meteorological phenomenon that has caused unusu
ally rainy and cool weather in South America while keeping North America warm and dry.

In this case the downpour triggered avalanches of mud, rocks and boulders on Mount Avila. Mount Avila lies between Caracas and the Caribbean coast where La Guaira is located. Overturned cars and buildings buried in mud l
itter much of Venezuela's coast. And in the coastal town of Los Corales, truck-sized boulders now stand where a week ago there were luxury vacation homes. News reports say that the town's residents have all either evacu
ated or killed.

While information is still sketchy, at least three high frequency ham radio relief networks are believed to be in action on the 20 and 40 meter bands. One report out of Miami says that 7 point Zero-9-Zero MHz is being us
ed by what appears to be a Venezuelan ham radio international relief operation. Other stations have been heard passing traffic on 14 point 142 and 7 point 1-Zero-5 MHz at various time of the day.

Meanwhile, reports from relief workers at the scene say that international aid is beginning to arrive. This includes nine specially equipped search and rescue helicopters and more than 100 servicemen detailed from the Un
ited States. Even with this help on the scene, it appears as if Venezuelan hams will be supplying communications into and out of the devastated area, for some time to come. As usual, hams not involved in disaster commun
ications are asked to voluntarily avoid using relief net frequencies.

> From Miami, I'm Bill Burnett, KT4SB, reporting for Newsline.
(Newsline from media and on-air reports)

FCC Expands Yonkers NY VE Probe

Closer to home, the F-C-C appears to be expanding its investigation of alleged irregularities at an amateur examination session in Yonkers, New York, that took place on May 2. This, in a letter of inquiry to James Bonnet
t, KA2ZSA, who was listed as one of the volunteer examiner at the session.

In his December 8Th. letter to Bonnett, FCC Special Counsel for Amateur Radio Enforcement, Riley Hollingsworth, K4ZDH, asks Bonnett if he was present at the test session and if he personally signed the test session manife
st or any Forms 610 applications. Bonnet is also asked if he had applied any of the marks found on some answer sheets turned in at the session.

But that's not all. If Bonnett did not sign the test paperwork, Hollingsworth wants to know if KA2ZSA authorized anyone to sign on his behalf. The letter also requires Bonnett to explain how he became aware that his pur
ported signature appeared on the exam session documents if he was not actually an active member of the V-E team conducting the exam.

As previously reported, the FCC has dismissed applications from those who took their tests at the May 2nd session. It has told the applicants that their future amateur applications could be in jeopardy until questions ab
out the Yonkers exam had been resolved.

And in a related story, the FCC's Hollingsworth has responded to an inquiry from Winston Tulloch, KC2ALN, regarding the May 2nd Yonkers session. Tulloch had taken an Advanced class upgrade test and later had the upgrade
canceled after the session came under FCC scrutiny

In his letter to the FCC, Tulloch had requested that the agency permit him retake the Advanced examination. In his December 8Th. response, Hollingsworth encouraged KC2ALN to go ahead and retake the examination, adding th
at Tulloch's application would be routinely processed.

In his note to KC2ALN, Hollingsworth said that any alleged indiscretion at the session, was not Tulloch's fault and in no way does it reflect adversely on his qualifications to be an Amateur Service licensee. (FCC)

**

Don't Bother An Uncoordinated Repeater

The FCC has told an Anaheim California ham that he cannot disturb the operation of a repeater that itself the subject of an ongoing investigation. In a December 15th letter to Jensen Woods, AH6MX, the Commission says th
at it has monitoring evidence that AH6MX has been deliberately and maliciously interfering with radio operations of the KC6OKA repeater system in the Los Angeles area. This includes broadcasting and deliberate harassment
of other operators on the repeater.

But here is where the strange twist comes in. As previously reported, the FCC is investigating allegations made by Mexican hams in Baja

California Mexico that the uncoordinated Los Angeles area repeater is willfully inte
rfering with their on the air operations. Specifically, with their ability to communicate through a long established repeater that is located just to the South of the United States and Mexico border. The letter to Woods
does take note of this, but says that the operating perimeters of the KC6OKA repeater are of no concern in this matter.

Specifically, the FCC says • and we quote • •While it is true that the Commission is reviewing the operation of the KC6OKA repeater, as well as its coordination, you do not have the right under the Amateur Radio Service r
ules to deliberately or maliciously interfere with its operation• • end quote.

In other words, the FCC appears to be saying that regardless of any rules the repeater itself might be violating, no individual ham can violate the same or other rules while transmitting on the repeaters input or output f
requency.

But that•s not all. The letter to Woods tells him that it should be looked at as a warning notice that his alleged on-the-air operation will not be tolerated. Also that any additional incidents will result in a monetary
fine being levied against him and in revocation proceedings against his AH6MX license before an Administrative Law Judge.

**

BREAK 1

This is Newsline, heard on bulletin stations around the world, including the WB5RAP repeater serving Purcell Oklahoma.

(5 sec pause here)

**

More Closed Than Open

Southern California has far more closed and private repeaters on the 70 centimeter band than it has open ones. This according to Worldradio Magazine editor Rick McCusker, WF6O.

McCusker got interested in the open verses closed Southern California repeater situation while on a business trip last October•s A-R-R-L Southwestern Division Convention on board the Queen Mary Ocean Liner in Long Beach.
He notes that the ARRL Repeater Directory lists 482 repeaters operating in an area that includes Los Angeles, Orange, Kern, Imperial, San Bernardino, San Diego and Ventura counties combined. Of that 482

only 39 are list
ed as open and available to the general ham radio populace. The remaining 443 machines are off limits to all but those chosen by the system license holder to be repeated.

WF6O also reports that he's heard rumors that some of these closed and private repeaters charge between $100 to $200 a year. His editorial appears to question the legality of charging to access a repeater, asking the que
stion of what constitutes a reasonable access fee.

According to McCusker, he had the opportunity to bring this situation to the attention of the FCC's Riley Hollingsworth, K4ZDH, at the recent Northern California Pacificon ham radio convention. WF6O says he gave Hollings
worth a peak at Southern California repeater listings in the ARRL directory. Hollingsworth's only comment to McCusker " quote " "This isn't good." (Worldradio)

**

Maine Hams Assist in Missing Person Search

Hams in Central Maine recently helped in the search for a missing person. On December 7th, authorities began a hunt for a young woman who had been missing since the early morning hours. This, in the woods and near a lak
e where she was last seen.

Maurice Dandeneau, K1STB, reports the search was in his neighborhood in Winthrop, where canvassed the area door to door. Dandeneau says that he offered the services of the local Amateur Radio Emergency Service group to
assist. He then and got on the air using the 146.88 Winthrop repeater where received assistance from several hams.

This story does have a happy ending. Dandeneau reports that the young woman was found that afternoon. She was in good condition and only about four miles from her home. (ARRL Letter, Repeater Users Remailer)

**

Young Ham in Red Cross Errand - S.K.

Some very sad news with word from the ARRL of the death of a popular young Connecticut ham. Sixteen year old John E. Schmeltzer the Forth, N1ZKF, of Greenwich amateur was on an errand for the American Red Cross when he d
ied in an automobile wreck on December 6.

According to a Greenwich newspaper report, Schmeltzer was a volunteer in the Red Cross Communications Division. He and his best friend Dwight Renfrew the Third were killed when Schmeltzer's car went out of

control and s
truck a tree off a rain-slicked highway.

Students at Greenwich High School, where both were juniors, were released from classes to attend separate services for the two. Hundreds of mourners packed St. Michael Church for Schmeltzer's service on December 9th. (A
RRL Letter)

**

FAR SCHOLARSHIPS OPEN

And perhaps its apropos that we also report that a well known ham radio organization is once again doing its part to insure that some young radio amateurs get a good college education. This, as the Foundation for Amateur
Radio announces plans to administer seventy-three scholarships for the 2000 to 2001 academic year.

This years scholarship awards range from $500 to $2500. In some cases preference is given to residents of specified geographical areas or the pursuit of certain study programs. Additional information and an application f
rom may be requested from the Foundation for Amateur Radio Scholarships, P.O Box 831, Riverdale, Maryland. The zipcode is 20738 (FAR)

Project Echo ﷺ Y2K Around the World

A special on the air operation to ring in the year 2000 will chase the date change around the world. Jeramy Boot, G-4-N-J-H, reports on Project Echo from Nottingham in the U-K:

Boot Pkg. Here
In-Q: Project Echoﷺ
Out-Q: ﷺand v-beam antennas.

Q-S-L this one as directed. (G4NJH)

**

W2M Sacramento California Y2K Staton

Project Echo is just one of many ham radio commemorative operations taking place, world wide. Another is W-2-M which is the special callsign for the Millennium Celebration from Sacramento, California. This station will
be on the air from December 24th, 1999 to January 7, 2000. A commemorative card will be available for this operation. Q-S-L via George Steinert, N-6-Zed-S with S-A-S-E. (Press release)

**

DISCOVERY IN ORBIT

After an unprecedented nine delays, the space shuttle Discovery carrying three ham radio astronauts but no SAREX gear blasted on Sunday December 19th for a repair mission to the Hubbell Space Telescope. At 7:50 P-M Easte
rn time Discovery soared off its launch pad at Cape Canaveral Florida, lighting up the nighttime sky for miles around.

Included in the crew are three hams. They are astronauts Mike Foale, KB5UAC, John Grunsfeld, KC5ZTF, and European Space Agency cosmonaut Jean-Francois Clervoy, KC5WKG. Unfortunately, the mission timeline did not permit
scheduling any Amateur Radio activity and no SAREX equipment as manifested. No matter -- as numerous ham radio repeaters around the country did relay the audio from Discovery as the Mission Specialists performed their sp
acewalks to repair the Hubbell's deep space seeing eye

By the way, this was NASA's last chance this year to send the shuttle and seven astronauts to Hubbell's rescue. One more postponement and worries over possible Y-2-K computer problems would have bumped the flight into Jan
uary. (K6DUE, published news reports)

**

Ariane 504 Launch A Success

Also reporting a launch success is the European Space Agency. This as E-S-A successfully launches its new Ariane 504 heavy launch vehicle.

On December 10th, the new Ariane booster successfully orbited a large X-ray observatory payload known as the X-M-M. This is obviously very good news for this launch agency and great news for the Phase 3D ham satellite wh
ich is slated for a future Ariane launch. (AMSAT-BB)

**

DIREC-TV now has NASA TV - Kind Of

And there is some good news and some bad news for ham radio space enthusiasts who like watching launches and the like. The good news is that the Direc T-V home satellite television network began carrying NASA T-V on Wedn
esday December 15th. The bad news is that its not on the primary Direc T-V satellite. To get the feed Direc TV says you will need a new Direc T-V Plus system that lets subscribers watch two satellites at the same time.
This is because the NASA feed is on their newly launched bird. Word is that disgruntled hams are deluging the Direc T-V website with complaints in the hope of getting the service to move NASA television to its primary
satellite feed. (N6BIS, others)

**

AMRAD Low Frequency Beacon Project Expands

A second AMRAD sponsored low-frequency experimental beacon is now on the air from Northern Virginia. The W-A-2-X-T-F beacon can be found on 136 point 745 kHz and is a part of the Amateur Radio Research and Development Cor
poration's experiments to gain low frequency experience in anticipation that the F-C-C may allocate an amateur band at or near 136 kHz.

The new beacon at the home of Ted Seely, A-A-4-G-M, near Front Royal, Virginia. This is one of twelve W-A-2-X-T-F proposed sites. It runs a 175 watts out to a 1600-foot long antenna and transmits a continuous message in
Morse at a speed of 5 words per minute. (AMRAD)

**

DX

In DX, K-2-W-E also known as 3-W-6-W-E and X-U--2W-E reports that he will return to Vietnam in February or March. He also says that he has permission from 3-W-6-L-I to operate from his farm in Vung Tau. This location i
s about 55 miles from Saigon right on the South China sea. He says that he will make every attempt to operate on 40, 80 and even 160 meters if he can get the license. (OPDX)

Also, the Kermadec D-X Association advises that all QSL'ing for the January 1999 Zed-L-9-C-I DX-pedition to Campbell Island is up-to-date. As of December 10th nearly 55,000 QSL's had been mailed. (OPDX)

**

UKRANIAN PAGER DEBACLE

And finally this report from the Ukraine about a bunch of pagers gone wild. We don't know how much of it is true and how much is urban legend, but it does lend itself to the spirit of the holiday season.

The story goes this way. To celebrate the ringing in of 1999, a Ukrainian businessman bought a pager for each member of his staff as a New Year gift. He had them in the back seat of his car and was driving to his offic
e when suddenly, all fifty pagers began to beep at the exact same time. He was caught off guard and drove his car into a lamp post.

After he had assessed the damage to the car, the businessman turned his attention to the message on the pagers. Reportedly all fifty had the very same message on their readout screen. They said -- quote -- "Congratulati
ons on the successful purchase of your new pager!" (published news reports)

With plenty of drive and a true peak reading meter, i typically see between 400 - 500 peak at 14.5 volts into the dummy load. With some very simple mods, a good one will top 500+. If your using CB type meters (PDC, Dosy, etc) at slightly lower voltages, don't expect to see anywhere near these levels. Sean
>

-=PEAKABOO=- wrote in message <843pun$9s8$1@nntp1.atl.mindspring.net>...
At 13.8 volts with a good set of power meters you should see between 300 and 350, some TS 350's will produce a little more, a lot has to do with the amount of drive applied to the amp.

Tim, the radios use the same linear pack. The basic "barefoot" radio inside the 6900 is slightly stronger, so that may account for the slightly better numbers that your seeing. That and parts tolerance and alignment.

As to your 2970 getting squirrely, you probably have a ground problem, high swr or the input impedance of the amp your driving isn't too hot. The stray RF voltage is getting into the microprocessor circuitry and playing havoc with it. Other than that, i'm glad you enjoy the radios. Sean
>

n8vpm@stratos.net wrote in message <8442pjovu1@nnrp1.deja.com>...
hi there, name is Tim.i own both radios and i can say i like the TR-6900f much better, reason is the 2970 uses a micro processor and some times if you use a amp like i do.. the rf tends to scramble the processor..and some times just using the radio by it self it will scramble..and this is not a problem with only one radio, i have owned 6 of them and they all do the same....i just got the TR-6900 F jumbo, and i like it a lot better..no processor,BIG watts!180 watts PEP ssb,24.200Mhz. to 29.995Mhz. and is very stable..so i would get the 6900 with out a second thought! hope i helped Tim Holt N8VPM

Kind of like the amateurs and 30 meters...

200 watts PEP on 30 meters, 1500 everywhere else.

Nothing but that changes.

Dont drag 30 meters into this. that's a fine band. don't forget... it's also cw only. it's a different matter to shout obscenities at each other in morse code!

3709. Re: The Key to Crystal Clear Audio...

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3865bc88.108251532@news.iserv.net>
Source record: 17158

Greetings!

With strong emphasis on clean RF output, a radio with a typical mod limiter will sound much better if Daves advice is followed.

Minor tweaking to audio filtering in the mic amp sections do wonders in making a "stock" flat-sounding radio a joy to listen to.

The problem lies in the tonal voice the person has.

Tone from each person is different - and the radio has to accomodate the different types of tone for each individual.

So they simply do a generic filter design with the thoughts that most people will "sound normal" - with some exceptions.

To make a radio sound like you, you'll need to make some changes, but not real big ones.

The idea of what you're asking - it is possible and not difficult.

The best way to know "how you sound" is to use a monitor radio with a set of headphones, and with the radio under test using a dummy load.

While Dancing with the Mouse on Tue, 21 Dec 1999 08:26:17 -0500, the Modem interrupted with an MNI from "Dave Hall <nojunkmail_n3cvj@worldlynx.net>", and the MotherBoard buffered this to Video RAM:

3710. Re: Best Mobile Antenna For Semi-Truck?

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <8aj94.1718$M56.82778@news.corecomm.net>
Source record: 17159

It is hard for me to be specific here, as i don't know the exact installation, but here are some basic guidelines.

Look for an antenna that has the coil up as high as is feasible. A longer shaft is what your looking for. The bottom of the coil should clear the flat of the roofline by a few inches (if possible). The coil should also be "air wound" and not wrapped directly onto a coil former. Look for tubing instead of wire. Quality of construction is very important, so look carefully and ask about warranty. Try to keep the overall length reasonable, as you want to keep the antenna as vertical as possible. A very SLIGHT forward lean is acceptable, since the stinger will typically lay back somewhat. NO "billy big rigger bull-horns" !!!!

I do NOT recommend the Wilson 2000 or 5000 for your installation (seems to be a common theme around here). While Wilson's are not bad antenna's, they are over-rated and over-priced in my opinion. If you wanted to stay with a lower profile antenna instead of going to a big "tubing type" antenna, you would be far better off with a Penetrator / Solarcon / Bandit style of antenna. These are more broadbanded and load up MUCH better. While the Nugatron LX-1000 suggested elsewhere is an excellent antenna, it does require a hard lean forward due to it's length and is physically bigger than the Penetrator's.

Keep in mind that you'll need a good mount and stud. I prefer heavy duty aluminum mounts (instead of stainless) with a good stud, like the Francis M-102. MOST stainless mounts are not grooved and don't ground as well as their grooved aluminum counterpart . They are also much poorer conductors at RF frequencies. While the stainless is measurably stronger than aluminum, they are typically much thinner and tend to flex more also.

Run a heavy ground wire (8 gauge is fine) from the mount down to the frame, breaking it up along the way. This gives the shortest path to ground and multiple points to ground in case one contact isn't good enough. Hope t his helps. Sean

Sean, I guess I didn't think about giving all the information..I own a 1999 Volvo with Stainless Steel Mirror brackets, not the plastic ones you see now..I have a under the cab exhaust due to the freight I haul, (jet engines on a deck trailer 80% of the time), and a 48' box the other 20%.
I run a Galaxy 44 with a Davemade amp keying around 400, swinging to 900 watts...I have a stainless mirror bracket, 18' of RG-213/U coax, and 50' of 8ga. stranded ground wire sitting here waiting for my antenna

purchase..OH,and I run a 6' jumper between the radio and the box.
I hope you can give me some info on decent choices for my set-up..Merry Christmas!!!!

3713. Re: To cut the modulation limiter or not to cut....

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3865be60.108723722@news.iserv.net>
Source record: 17162

Greetings!

The idea of "cutting the limiter" is the easiest way, or excuse, for a tech to get money from you.

It also shows how gullible people can be.

And, as a side note, a quick way to meet neighbors that you thought you never had to deal with.

- This is what some people can consider "damage".
In a way they are right, you might find yourself with a lot of damage to personal property or even yourself if you don't correct the problem.

It gives a new CB'er a bad reputation - and others can hear the effects.

Go ahead and take out the limiter - you're now the "talk of the town", litterally. Sound loud? Well, just think about that.

If you're new, or already into CB, you know about interference. How it occurs is thru different means, but all have a common reason for why it occurs. And thats with limiters, or lack thereof.

I have purchased used radios over here, that people have removed the limiters out of - so they can "get out".

I put the limiters back in place, listened to the radio. Located the problem section, and a swap of a couple of parts, done. These radios have better audible dynamic range, greater low-level sensitivty - all without having to remove a limiter. Maybe change the limiters response, but overall audio is clearer and better - and you can say the limiter is in place.

And the neighbors also stay in their place.

A good tech should have you talk on the radio to get an idea of what they have to do to get the radio to sound like your radio.

A tech that clips the limiter - might need to be castrated.

Or take away their bread and butter - so they starve to death.

So, when you run the other way, be sure to get others to follow you out the door. And hold it open if necessary.

I'm probably sounding mean, I don't mean to [SIC] but whether you live in a big town, or open prairie - a radio without a limiter will get

you noticed, even from people that don't own a CB.

How well they treat you, depends on how well you run the radio.

While Dancing with the Mouse on 20 Dec 1999 18:27:47 GMT, the Modem

3716. Re: Best vertical antenna???

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <rFj94.1764$M56.83472@news.corecomm.net>
Source record: 17165

The Starduster is about as close as you can get to a "perfect" 50 ohm load. It is very broadbanded but "suffered" from a low angle of radiation. This gave it a very bad reputation for throwing TVI like crazy. Unlike the A-99, it wasn't due to poor design or feedline radiation though.

Due to the sharply sloping radials and the typical low mounting heights of most CB installation, much of the signal was blasted directly at telephone lines and roof mounted TV antennas. This caused a lot of front end overload for sure.

If mounted up HIGH, this antenna worked like GANGBUSTERS !!! While "height is might" is true for all antenna's, this antenna REALLY performed well up in the sky. The last one that i installed was appr. 53' up to the hub, putting the tip at about 62' high. Raising it up this high and installing RG-213 with a proper ground system completely negated TVI, even on rabbit ears which were being used in the living room. The next door neighbor couldn't understand why this guy went to raising the antenna and then stopped talking on the radio !!!

At lower mounting heights, the Penetrator is by far a better antenna. It offers a slightly higher angle of radiation along with a longer vertical section. Both of these add up to getting the signal up and over the rooflines more efficiently.

As to being easy to mount in a tree, i would think that a "stick" would have been a whole heckuva lot simpler to work with than a Starduster !!! Sean
>

C.H. Parsons wrote in message ...
The Starduster is my favorite, but I also like the Penetrator. I happen to like the Starduster because it worked exceptionally well, and is really easy to install in the top of VERY tall trees.

Yes.

> both driver and final would be nice.

25 mA for the driver, and 50 mA for the final.

It's not a sin to run the bias up higher than stock
in order to get more power out of the radio as long
as there is no risk of instability. For example,
let's say you're not running an amp and the antenna
is a resonant, 50 ohm load. In that situation
there would be no problem with running higher than
factory spec bias.

What city do you live in? All I heard on the FRS frequencies on Xmas were people testing the distance capabilities of their new radios. I did hear one dorky kid tell everyone who was on "his" channel to switch to another frequency, but I hardly think that qualifies as "FRS Terrorism." Far worse was what I heard on 7258 kHz LSB Christmas afternoon: WB9CIK jamming for at least two hours with an overpowered, distorted signal and some of the foulest language I've heard on amateur radio. Of course, there was a idiot or two raising H & D on channel 19 Xmas evening as well.

Redneck identifiers are the sound you here on those real loud spanish speaking stations when they key up their mic's. They are all slightly different and explained.
They are different from the Roger Beep. As explained in the poste previous to this one. They all serve a purpose if used correctly, but so doesn't an echo board, amp etc. Its those who abuse them that get the items a bad rap. Poor little inanimate objects anyways. :)

Found this on ebay.
Vehicle mounted direction finder
http://cgi.ebay.aol.com/aw-cgi/eBayISAPI.dll?ViewItem&item=224504910

Here you go guys. You can become a jr. fcc feild investigator. Buy this direction finder and you will be able to find and stop those evil cb'ers who are out to destroy the world as you know it.The perfect late Christmas gift for the Goverment fearing, law admiring, Hambo who desires to be the envy of all his fellow comrades.
Just buy it, hook it up and go. No need for special tranning. After all you are a Hambo know it all. Just go out there and find them, kick in the door, and take all that nasty equipment away from that low life law breaking cb'er. Be the hero, buy it today.
Happy Holidays
Ben Dowers

3738. Re: Best vertical antenna???

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <3866307C.A8E65B79@qnet.com>
Source record: 17187

Hello Sean: Yes wider bandwidth and a mechanically stronger antenna, are my goals.

In the high winds of the Mojave Desert, the MaCo V5/8, Penetrator 500, A99, ABS1600, and Sigma 5/8 seem to hold together pretty well. The thing that bites a lot of CB'ers, is not guy wiring the antenna push-up mast at the base of the antenna. There is at least 3 MaCo V5/8 antennas that where installed (up here in the Mojave Desert) on a 30 foot push-up mast, without guy wires attached to the base of the antenna. Almost any lite weight guy wire will save ya. But NOT guy wiring or supporting the base of the antenna puts way to much mechanical stress on the thin walled top section of the push-up mast. The 3 antennas are not straight up, but wind 2 antenna are pushed over to a 20 to 30 degree angle, the 3rd antenna is totally bent over, with the antenna inverted 180 degee's .....TILT!

One problem here is, the larger the diameter of the vertical element, the wider the bandwidth, with other considerations involved. But the 1/8 schedule increments of the aluminum antenna construction, or buy having the antennas made from good quality aircraft aluminum tubing, being constructed with large diameter tubing at the base, with smaller diameter tubing fitting into each lower section, makes for a strong design. At the sacrifice of some bandwidth. I am working this, along with the matching system.

Jay in the Mojave

i agree , i have a guy 4 miles from me whom has a big linear and thinks is a real radio wizard , but in fact he's like many of our race teams today, it's not how good a mechanic you are or how good of radio tech you are, it's whom is willing to spend the most money to drown you out. linears are fine when use with discretion and at the right time. this channel blend over is what gets to me. the guys that defend this disrespect caused by a few with these linears, just haven't been walked all over yet. but they must remember there is always someone out there with more money than they and when they move in down the street and they get out done by a bigger linear than they have and can't afford a bigger one , they'll understand!!!! thanks jerry in nebraska.

3743. Re: Best vertical antenna???

Newsgroup: rec.radio.cb

After using a variety of vertical antennas , I think the one that worked the best in my situation was a Super Scanner, that's after using a super magnum, starduster , hi gain half wave , and one of the early big sticks,yeah I know , not a true vertical , yeah I know , if your gonna spend that much just put a damned beam up, lol , 73's

3744. Cobra 148 GTL ST and Cobra 200VM For Sale

Newsgroup: rec.radio.cb
Date: 1999-12-26 00:00:00 UTC
From: jouc@oit.edu
Message-ID: <3865d492.28358816@news.jps.net>
Source record: 17193

I have the following for sale:

Cobra 148 GTL ST AM/USB/LSB 40 Channel CB
Asking $85 + Shipping

Cobra 200 VM 200 Watt Variable Modulator with Dual Cooling Fans
Asking $100 + Shipping

They're both about a year old. In great condition, I have pictures of
the previous items at this location.

http://internet.oit.edu/~jouc/forsale.html

Please have a look, if you like, you can inquire at
e-mail: jouc@oit.edu

You got the measurements right on the nose. I don't have the four top
10" radials. What frequency do you think its tuned for with out those
top radials?

Sean,

I agree, but think that one thing need to be added...

The radio that you use to excite the amp can also make a difference as to what you see on the wattmeter, not just the dummy load / antenna relationship.

Toll Free

The answer to the first question though is I don't know why they stopped production on them. There is a replacement final you have to do some creative
switching. These are found in your High end Export radio's.

>>>And just what would that final chip be, pray tell?

The rest of us are just DYING to know... I am tired of putting real transistors in place of the 477... So what have you found to work?

Have a Uniden 2600. With all accys and svc manual. I am not sure of the difference between the 2600 and 2510. I'm asking $150.00+$5.00 (Shipping, I'll make the difference). Unless.....you have any good stuff to trade. I like boatanchors.

The FRS is just another name for CB on UHF. Yes I know the abbreviation doesn't match but that is the what it's worth. The FRS showed some potential as a great radio service. For example there is a 5 MHz split between channel 1-7 and 8-14. Just right for a repeater with the possibilities of phone patch capabilities for the non-ham.
I agree, what a shame . . . .

Most PLL chips have a data input, a clock input and an enable input. The data input is a number that is used to set the local oscillator frequency and thus the RX and TX frequency. If you get the part number for the pll chip, you can find the specs for timing and word length and then use basic or some other simple language to control the printer port to set the rx/tx freqs , scan , memory whatever. Just about all recievers and tansmitters , tv, fm radio, etc, use pll chips for tuning nowadays.

oops I forgot to post the web site. This is for informational purposes only :)

http://www.fairradio.com/index.html
COLLINS 208U-10 KW POWER AMPLIFIER, the standard for 2-30 MHz SSB-AM-CW 10 KW (PEP) amps; requries only 0.2 W RF input to drive. Output load & input impedance: 50 ohms. RF bndwidth: 16 KHz. Can be tuned automatically with compatible control circuit or manually from front panel. Two 4CX350A tubes drive 4CX10000D PA tube. Has vacuum capacitors 12-1500 Mf 15 KV, 50-2300 mf 5 KV and 3-30 pf 15 KV. Similar to picture; with manual copy. Requires 195-225 or 380-440 V 3 0 47-63/400 Hz. 40x70x27.5, 1500 lbs. USED-NOT TESTED, less 4CX10000D, $3900.00
Manual for 208u10, partial repro, $45.00

Some simple facts to think about....The maximum power transfer occurs when the load resistance equals the source resistance. Under these conditions, the power dissapated in the source is equal to the power dissapated in the load. So max power transfer implies only a 50 percent efficiency. To pump 1 kilowatt into the antenna would mean that the transmitter is also putting out 1 kilowatt of heat. For best efficiency , the source resistance needs to be much lower than the load resistance. If a transmitter is designed for a 50 ohm load, it is not neccessary that it have a 50 ohm output resistance, in fact, the higher its output power, the more likely, it will be designed for efficiency rather than Z match. So it is entirely possible that by using a lower Z antenna rather than a 50 ohm antenna, you will get much more power up untill the point that the amplifier blows from overcurrent. The transmission line needs to be matched to the antenna,for max power transfer, but the transmitters output Z does not have to match the line.

I would go for the beam with lower power for three reasons. ONE -- if you get a GOOD beam the gain will more than make up for the high power on an omni. TWO -- All you power and listening ears will be pointed in one direction. You won't be hearing the noise from everyone else in the world. THREE -- It's less expensive to get a GOOD directional antenna than spend big bucks on the garbage CB amps that are out there anyway.

For your information,

I am looking at the paper work that is included with the Solarcon Co-Phasing harness that we sell, that is used for the purpose of co-phasing two A-99 antennas. The paper work instructs the user to place the two A-99's 18' apart.

This transforms your A-99's into a Bi Directional Beam Antenna and results with an additional 3.8db of Gain in two directions.(as per the Solarcon paper work)

The harness has included a double female connector to connect the harness to your present 50 ohm coax.

We have sold quite a few A-99's with the co-phase harness.

OK, this is a 6 month old, turbo-mod amp that will do 300W average with a swing from 1W dead key to 10W with modulated. A 10 on a scale of 1 to 10! Clean on the inside and outside with a 10db receive preamp, SSB mode and variable power. It has a clearn output, no appreciable harmonics. I want to sell it to help pay for the 1200 I am buying. Reasonable offers will be accepted. Buyer pays shipping. Cash or money orders only. It can be seen if you are in the Metro Washington DC area.

John

Yes,but there are many ways to phase 2 antennas depending on what you
are trying to do.
Without even buying another antenna you can get directional gain by
spacing your vert 1/4 wave multiples fram a pole or tower longer than
the antenna.Example:mount the antenna 1/4 away and you get a broad lobe
(with slight gain opposite the pole and a slight but fairly sharp null
toward the pole.1/2 wave yields 2 lobes and 2 nulls(figure 8).

Kinda vague but if the beam is horizontal it would hear a lot less
noise.If price is no object I would take more antenna over more power
any time.

This message was posted anonymously:

It's truly amazing how much of a complete fool ICM really is. I have been sitting here on the NG sandbagging all of his so-called "posts" for months and have literally vomited at his behavior and attitude. I have yet to see someone as low at that complete piece of shit parasite.

He is the type of person I wish fucked with me - in person - face to face. The reason being is because he is one of those goddamn typical ass-fucks who plays tough guy BEHIND the mic. and keyboard. If only I could have my wish. I'd take his redneck ass deep into the woods and show his pathetic little self what a NY Guinea from hell could do to his inbred little ass.

This is dedicated to all of those whom ICM has annoyed and fucked-with. His day will come....believe me...it will.

the alfa tango directory does not go up that high and any other prefixes
that i have heard by other org's do not mention anything close. the
answer then would be no, there is no country/zone code for that number.

No problem at all .
as long as the two antennas share the same ground source.
and are 1/2 wave length apart in distance. you can make an boom
for them. also they need to be fed with an 1/4 wavelegth of 75 ohm
coax each going to an T connector, then 50 ohms from there.
I have done this for years with great results. the gain factor I'm not
sure of. but it does work very well, the tx signal will be off the
side of the boom {broadsided} and you can null out other
stations as well with this setup.
hope I have helped.

Hi all,
I'm hoping somone can help me understand a couple of things on the blackface Jackson.
1. There seems to be 1.5 second delay between key up and modulation
i.e. when you key the mic and speak no modulation is heard until 1.5 seconds has past. I've hear this is normal but is there a way to by pass this ?

2. Does anyone know what the AM/FM LSB and USB power tweaks are, as well as modulation tweek.

p.s. I have 2 of these radio for sale brand new in the box. I'm offering them at 325.00 including shipping (UPS ground) or reasonable offer.
The ones that are for sale will remain box stock, 6 bands 25.615-28.305 coverage, pictures available on request

Dave

You, my friend, make no sense.. I think you know what your talking about (in theory), but you have no idea what the terminology means...

> hi there, there is several reasons why they need to be inductively very
> close to being the same.

Inductively?

Inductance is a measure of reactance.... Transistors aren't measured for inductance, as the small internal wires are so small that their is no gain at their even close-to-being resonant frequencies... The capacitance is measured, and it will make a small difference to the circuit they are placed in, but not enough to worry about at 30 megs!

.ill give one example...if you have two MRF-455
> and they are not close to being the same..one could could be making 60
> watts and the other could be making 50 watts...

If your seeing 20 percent difference, then you have them from two VERY different gain lots. Motorola was the first semiconductor company to beta match their transistors, and your right about the effect, but the matching that RF Parts does isn't necessarily done for gain matching... Theirs is more for linearity of the multiple transistored amplifiers.

now in your mind what do
> you see wrong with that picture? and also what do you think could
> happen to thoes expensive transisitors you were suckered into buying?

With the scenario that you paint, they would break into self oscillation if they where being pushed to their maximum capabilities...

However, if you leave the transistors in their linear range, then matching is not necessary, just making sure they are from the same gain lot is more than enough.

> 2100 peak watts.

No, not necessarily.

If you are using an AM signal that is modulated more than 100 percent, their is no meter on the market that will guarantee accurace.... This is due to the instilled squarewave: And everyone knows that a squarewave (in theory) has a infinite amount of power in its leading edge spike.

So, if you want to see the appropriate numbers, you better feed the box a pure single tone sinewave that is 100 percent modulated.

Or, we can feed it my 148 that makes 8 Bird watts +, but only does 12 to 14 PEP. Someday I can show you how to do that trick, too!

I want 3x my money back from the maker if it doesnt do
> this. Since when is a 64 or 32 as effiecent as a 2 pill

Why wouldn't it be?

Are you saying that just because you increase the number of transistors, the efficiency of the box goes down? The efficiency of each transistor has nothing to do with the total amount of transistors in the box.

Your combiners and splitters may not be able to handle the power levels involved, but that has nothing to do with the efficiency of the transistors. If your combiners can't handle it then they start getting warm, and that is where people start seeing the "deflated" multiple pill numbers.

Take a normal
> exceptional running 2 pill that holds 500 watts x that by 32 and there
you
> have 16kw which is still a high number in my opinion.

17Kw was what won Hot Springs out of a 32.

We can even go a few
> steps further How many alt on the 64 pill itself,

Their are 5 300As on the 64.

If the 32 needs at least 3
> a 64 would require 6.

You stated when I was arguing with Prozac that 3 250s would do the 32 fine. That means that 750A does 32 pills, and 5 300s do 1500, so I guess that is more than enough....

And the 300A Leece units do closer to 400 A at shootout levels.

How many for the driver ? The 64 would require at
> least a 16 pill for drive

I beg to differ. People are driving their 32s with 1100 watts, so 2200 to 3Kw would be fine drive. An 8 pill will do that... And if you are really hitting it hard, it will do more. However, I prefer to loaf along, and I would also recommend a 16 pill.

Which everyone says needs at least 2 alts

Only if you are running 165s or 200s... Get to the 300A alternators and you can run one singly.

After all, how many watts do you see out of your 3CX3K box with a single 165 amp alternator on it? ;-)

How many
> to run the truck,radio and predriver?

A stock alternator

Mulehead in Missisippi this year with

"Toll Free" <tollfree@bigradios.com> wrote in message news:7tU94.1785$>
>
> 17Kw was what won Hot Springs out of a 32.
==========
Never in a million years is a 32 pill holding 17 kw , I am sorry i refuse to believe you can see more watts per pill with a 32 than you can with a 2 pill or 4 pill etc. 17,000/32= 531.25 watts per pill lets assume you meant a 64 pill . 17000/64= 265 watts per pill

> You stated when I was arguing with Prozac that 3 250s would do the 32 fine.
> That means that 750A does 32 pills, and 5 300s do 1500, so I guess that is
> more than enough....

Depending on who built the box the efficancy will make a differance, yes i think 3-250 are enough for a 32 so 6 250's would be ok for a 64

> I beg to differ. People are driving their 32s with 1100 watts, so 2200 to
> 3Kw would be fine drive. An 8 pill will do that... And if you are really
> hitting it hard, it will do more. However, I prefer to loaf along, and I
> would also recommend a 16 pill.
==========
Where do you differ a 32 pill would require a 8 pill , since 1100 watts is what you could get out of a 8 pill with driver volts the same goes with the 16 pill about 2200 watts at driver volts would be fine. Like I said a 16 pill would be prefered for a 64 pill. If someone tried to volt there 8 pill to drive a 64 they dont belong in keydowns plain and simple.

>
>
> Only if you are running 165s or 200s... Get to the 300A alternators and you
> can run one singly.
---
ok so there are 5 -300'a for the 64 pill and one 300a for a 16 pill and another stock alternator for the truck, driver, radio?

>
> After all, how many watts do you see out of your 3CX3K box with a single 165
> amp alternator on it? ;-)
==========
Never tried it I am sure it would be much less than the 240

> Who was he keing against?
> ==
I will find out.

Message-ID: <38682990_1@news.greatbasin.net>
Source record: 17241

The static I referred to can and does occur on aluminum antennas
as well as fiberglass.
I was refering to precipitous static. This will happen when wind
driven particles strike the antenna and leave an ionized charge on
the skin. The coax, as you probably already realize, is nothing more
than a capacitor at this point and depending on the length and style
of cable will easily store a high voltage charge between its
conductors.
I'm sure everyone has in some way heard or seen the arc that
occurs between the center pin and shell of a PL259 during this
event. Sometimes the arc happens in the radio or some other narrow
place where the static can jump to ground.
Someone mentioned a resistor of high value between the center
pin and ground of a SO239. Good idea. Others have used a rf choke in
the same place for the same reason. Good idea.
On the resistor idea: you dont need to use a high wattage part,
1/2 watt @ several hundred ohms will do just fine.
For the rf choke: just use something that won't become resonant
when installed in your particular setup or you may find a cloud
emanating from your rig when keyed.

Message-ID: <3cW94.16583$Ym1.699706@tw11.nn.bcandid.com>
Source record: 17247

The MOST you will get from a co-phased omni is about a 3 dbd (decibels over dipole) gain. But the jury is still out on co-phasing a base station antenna. In all reality, I don't think it would make much difference anyway. If you are looking for a REALLY GOOD omni, go with the IMAX-2000. It simply 'blows-away' an antron! I know. I've owned both. Also, for a long time, Antron 99 was advertising their antenna as having a 9.9 dbi gain. THIS IS A LIE!!! It is IMPOSSIBLE to get that high of gain out of an omni. PERIOD. On 11-meters, anyway. They have now "reconsidered" the gain claim, and now place it at 3.3 dbi. GEE... a 3 year 'typo' maybe?

i think there might be a little confusion on my post about being a low life cber! The reason i used this is beacuse the responce i get from "some" of the local hams about myself talking on a cb. They look at me like im a minorty of the radio world, which i my be! Its kinda funny considering most of these guys got started in Cb themselfs, But anyway, i wasnt tryin to down any cber but to mearly express my opinion on the subject. As far as the ham part of it i look at it like this, its just like the cb band if you dont like it turn the knob to the left and set it on the shelf.Or got to another NG! If i offended anyone im sorry! I like you, have the right to voice my opinion.I can agree with the poeple who talk about the 1000 watts to talk across town.It does suck and there is a time and a place for everyting,and i do agree that this is not the time.

3859. Santa in big trouble...

Newsgroup: rec.radio.cb
Date: 1999-12-27 00:00:00 UTC
From: "Scott (Unit 69)" <upplus@hotmail.com>
Message-ID: <3867028C.1E8B949B@hotmail.com>
Source record: 17308

"The American Civil Liberties Union announced today that it was bringing a lawsuit against Santa Claus for violations of the civil rights of children. An ACLU spokesman, Mr. E. Scrooge stated that, "Mr. Claus has been violating children's right to privacy and has been putting that information in a vast database. The information is then used by the law enforcement arm of Mr. Claus' organization to determine which children are considered naughty or nice. It is obvious Mr. Claus has violated the children's rights, as we have alleged in our suit, because of the memos and other company information we have obtained. In addition, we believe Mr. Claus has been engaging in mind control experiments designed to prevent the free expression of beliefs."

Among the documents presented to the courts today was a memo in which reads, in part:

You better watch out.
You better not cry.
You better not pout.
I'm telling you why.
Santa Claus is coming to town.

He sees you when you are sleeping
He knows when you're awake,
He knows when you've been bad or good
So be good for goodness' sake.

Mr. Scrooge claimed the document, which was obtained from a worker in the distribution department of Mr. Claus' organization, ". . . clearly shows a concerted attempt to restrict the rights of children to free expression and free thought. In addition, there are concerns about the security of the information. What would be the result of such a database being made available to other law enforcement agencies around the world?"

Lawyers at the Justice Department also confirmed today that they were investigating the possibility that Mr. Claus was at the core of a vast conspiracy against children. Anonymous sources from inside Justice stated, "We believe a large number of parent, ministers and teachers are involved in this business and we expect several of them will testify for the State in return for a lighter sentence." In addition, the same sources indicated a parallel investigation by the Department and the FBI on possible charges of smuggling on the part of Mr. Claus, "our records do not show Mr. Claus, or any one else paying any import duties or taxes on any items he has delivered. Since Mr. Claus has representatives in all of the States of the Union we believe he should have to pay state and local taxes on all of the goods he delivers."

Lawyers for Mr. Claus stated, "The charges of the ACLU are absurd. Mr. Claus is a well known and highly respected figure. His supporters are from around the world and his message of love and respect can, in no way, be taken as a form of "mind control" or a violation of the civil rights of children."

The lawsuit is complicated by the fact that Mr. Claus is not a resident of the United States or any country which the United States currently has an extradition treaty. It is unknown where Mr. Claus is at the moment, but it is believed he is hiding out at his north pole estate.

In a brief statement, read by his lawyer, Mr. Claus said, "I find the charges of the ACLU absurd and am confident they will be rejected by the courts. As for any criminal charges, I believe the Justice Department will discover they have no basis."

Experts are uncertain what possible effect the suit or possible pending charges might have on Mr. Claus' Christmas travels this year."

Your driver tube is a 6JG6A. I have the owners/service manual on this amp and the actual amp. That is what came in it from the factory but you can also use these cross tubes. 6KV6A or 6JT6A. Do not use another 6LQ6/6JE6C tube as it will not work at all. You can tell this by looking at the driver tube and see that there is no wire to attach on top of your driver tube. Your other 6JE6C tubes have this connection. Your driver tube doesn't have a metal cap on top.

No. You know what FRS is like... Its like all the Trolling Hams (notice, I didn't say ALL Hams) on this newsgroup.

I cant believe that soooo many Hams feel that CB is "worthless" as it has been coined. I myself would not want to "waste" (my opinion here) my time obtaining ANY kind of license to talk or dit dit dah dah dah on "special" frequencies, when I can talk on my CB radio for FREE!! I have RESPECT for some Hams especially those who have operated MARS to help me communicate with loved ones while overseas (yeah, military).... but some of you are just as childish if NOT more childish than some on the CB band. Its funny, EVERYONE hears what they want to hear.... so if you choose to switch that channel selector (or frequency knob of some sort) to a "channel" that has people speaking profanities and such, then so be it.... remember you MADE that choice! But, you CAN! at least in my area find about 6 channels where conversation is just going and going, mostly with the utmost respect to others mind you.....

Oh well..... nothing smart assed here.... so please show your maturity when replying.... if you think you have a legitimate rational argument.....

Otherwise, look in a mirror.

Jeffrey L Herrings (for all of those, YES, real name, Hank Aaron was just one of my favorite
baseball players, consider it a HANDLE on
the NG.... Gee took a
genius to figure that one out!)

Hi !!!

Does anyone can tell me what's country has 508 in prefix.
Thanx for your help.

Sorry for my english :-)

Bye

3870. Re: FRS Terrorism on Christmas Morning

Newsgroup: rec.radio.cb
Date: 1999-12-27 00:00:00 UTC
From: qrm2000@aol.com
Message-ID: <19991227064034.01156.00001035@ng-ft1.aol.com>

>The FRS showed some
>potential as a great radio service. For example there is a 5 MHz split
>between channel 1-7 and 8-14. Just right for a repeater with the
>possibilities of phone patch capabilities for the non-ham.

The reason for the split is that FRS is sandwiched between the GMRS repeater input and output frequencies. Equipment-wise and rule-wise, FRS is not repeater capable. Nor are phone patches allowed. If you need reliable communication over a wide area, investigate GMRS. However, as two-way radio systems like Nextel become cost-effective, GMRS looks less and less attractive.

Nextel can give you two-way radio communication over a very wide area (hundreds of miles). And you have an outgoing and incoming phone patch. It's my experience that a spouse is more likely to consent to slipping a tiny Nextel unit in her purse than to carry around a industrial-looking walkie-talkie.

Try changing the leanth of ths jumper between the 250XL and the radio and
don't use more than a dead key of 3 1/2 watts . uselly a 6 ft jumper will
work just fine.

I never made any claims as to the reliability or longevity of these so-called "ghetto" amps, nor did I mention any brand names. But the fact remains that your "pirate" amp was not designed to be "neighbor friendly". It was designed for competition, and as such is lacking in many of the components that commercial grade amps have, that provide harmonic suppression, stability, and class AB biasing.

Who builds these amps is irrelevant, as they are "cost reduced" to get the most bang for the buck, in the competition environment. Most of the guys that build these amps also have the capacity to build a "better" quality amp, but it would undoubtedly cost more and the market for them is not nearly as great. The people who buy these amps are mostly interested in big numbers. Being spectrally responsible is secondary (if at all).

The simple fact is that most CBers are ignorant of spectral purity issues until they get a bang on the door from an irate neighbor. "Clean" to them simply means that it sounds acceptable to other like-minded people.

I currently own 2 Dave made amps. Both of them "sound" ok. But they are also not something that I would run inside my house. I have them because I horse traded other radio gear. I'd trade them for a Texas Star DX-500 or 600 if I had the opportunity.

That's what I remember as well. The final tubes were simply used as a class AB linear amplifier for both AM and SSB.

If memory serves, the "modulator" stage was the same circuit used for carrier suppression (Carrier Balance) on SSB. They just "unbalanced" it and applied straight AM modulation. Same thing on the later solid state output ham rigs like the FT-757.

The BIG question is, are there any DIRECT replacements for the old
477/497's? I know there are some Japanese transistors that will "work"
(after you swap collector and emitter leads) but they are of a lower
power rating, and the radio will not do the numbers that it did with the
477/497. I have one spare 477 that I'm keeping just in case the one in
my 2510, goes up in smoke.
I did up a President Jackson with a MRF 455, stud mounted to the
heatsink. Lots of messy drilling, but it worked ok.

I just wish SOMEONE would market a direct replacement......

> constantly have nothing constructive to say.

Only one thing wrong with that "theory". Since all it takes to be a
"CBer" is to buy a rig and antenna, while to become a ham takes a little
more work, why would someone who has gone through all the trouble to
become a ham, be envious of someone who did nothing but plunk down money
at a radio shop?

I will say that there are SOME hams that may feel a bit cheated, since
they feel obligated to follow the rules, and it bothers them to see
Cbers doing all that they do, totally illegally, and seemingly without
the least bit of remorse. Sort of like the teacher's pet calling "foul"
when they see Little Johnny cheating in the back of the class......

Actually, in the areas that I've seen and read about, the SSB channels "officially" were 16 and 36-40. Not too much to ask. But as someone else pointed out, the term "gentleman" and "CBer" are not synonomous these days. Actually there are not many "gentlemen" left in society as a whole....

I doubt if you'll get much cooperation trying to keep a few channels clean for SSB. Too many people have the "If my dial has it, I'm gonna use it" mentality.

This is why a great percentage of SSBers have gone to the freeband.

Hello Sasquatch: What where ah shootin fer is a high performance 5/8 CB Base Antenna that isn't shorted by mass production design requierments. We want a antenna that is strong, that will handle all the wind, ice, mud-blood & beer, and work better than most, by a significant amount.

>Only one thing wrong with that "theory". Since all it takes to be a
>"CBer" is to buy a rig and antenna, while to become a ham takes a little
>more work, why would someone who has gone through all the trouble to
>become a ham, be envious of someone who did nothing but plunk down money
>at a radio shop?

Probably because many hams (even the ones on this newsgroup)
subconsciously know that they don't have the smarts or knowledge
of many CB'ers in this group or on the air.

Even when the try to self justify themselves in this group with a
piece of paper they fall short. They know it. We know it. And it
perpetuates a holier than thou attitude.

Thank god it does not apply to all hams. Many are secure enough to
not have to compensate for their shortcomings. The insecure do this by
putting you down so that by default it will bring them up.

It's to bad this can't be a help/discussion/question group. Many
times it becomes a self aggrandisizing forum for some who are
insecure in their place in the world.

Agreed.
If one volt didn't make a difference then:
15 volts was the same as 14 volts
then 16 volts would be the same as 15 &14
then 17 would be the same as 16, 15, & 14.

The same is true with drive every watt makes a difference.

3898. Co-phasing base vertical antenna - any good?

Newsgroup: rec.radio.cb
Date: 1999-12-27 00:00:00 UTC
From: Volfy <Volfy@ionet.net>
Message-ID: <848f72$9ar$1@ionews.ionet.net>
Source record: 17347

Would co-phasing two vertical base station antennas, say 9ft apart, net me any directional gain? Or is this a worse idea than a 2-story outhouse (as Ross Perot would say)?

I already have an A-99 and am thinking about buying another one to experiment. If it doesn't pan out, I'll use one for cb and tune the other for 10 meter.

Thanks.

3899. Re: RF TRANSISTORS

Newsgroup: rec.radio.cb
Date: 1999-12-27 00:00:00 UTC
From: Volfy <Volfy@ionet.net>
Message-ID: <848f73$9ar$2@ionews.ionet.net>
Source record: 17348

I seem to recall reading in Motorola's website that they factory match and color code their bipolars (presumably for an additional fee) so as long as you match the color dots, the transistors are "matched".

I got the impression they only measure and match hFE. So my question is: if I were to buy a bunch of the same bipolars, say 2SC1969, and pair them by their measured hFE, would that suffice for push-pull replacment pair applications?

--
Volfy,
You've got questions, we haven't got a clue.

Modulation above 100% will usually always cause TVI/RFI... Adding the resistor is much better than clipping it all together... especially if you wish to be completely understood on SSB....

Message-ID: <3867A648.C60BAD0D@qnet.com>
Source record: 17581

This was posted on 26 Dec 99.....

Hello No Name & Bob C:

Maybe if we ask Bob C. to give his opinion or measured results, on the Fiberglass CB Antennas he can add to a great posting he made a year or so ago. His posting was a great explanation of the static problems with fiberglass antennas .... Come in Bob C

If Bob C doesn't respond, I'll go and get the posting off my old computer.

I use to use A Shakespeare ABS-1600 5/8 Fiberglass Antenna, a significant improvement to the A99. I experienced static in the radio, it sounded like it built it self up, and then at a moment it was gone. I noticed a few times that I pulled off the the coax PL-259 connector off the radio, I received a slight static shock! You bet static build up, Big Ten-4. Glenn's (AB7RS) suggestion of a static arrester is a new one on me. I am ah gonna look into that one.

I figure a 10,000 ohm, 2 watt, carbon resistor installed at the antennas connection would bleed off the static energy, but never got a chance to try it. Maybe there's static energy on the outside of the fiberglass material, and there needs to be a slight resistive/conductive surface to pass the static energy to ground?

Hello Bob C ......

Jay in the Mojave

Hi, Sean
You mean to tell me that the starduster is better than a 5/8 wave ground plane?I had heard that the starduster was a 1/4 wave with 3 radials, and have always heard that a 5/8 wave had more gain than a 1/4 wave.Also I have heard the more antenna in the air the better.
How does the I-max 2000 compare ?

Happy New Year

Hi, all

I'm looking to buy a 13.8 dc supply.The load is 20 amps max, but I would like a little breathing room for the supply.I am using a 20amp continuous, 25 amp surge, and it seems to work too hard.Any recommendations on what rating and any other considerations would be appreciated.Cost is a limitation, can't get too expensive.

Thanks To all, and Happy New Year

hey there Craig... The FT-840 is a very good radio...I use one myself for the past 2 years.....Always get good DX on it....The mod is not really that hard......If you just follow the directions.....About 500-700 bucks would be a good price for one... especially if it has the FM board in it, and the AM filter installed.....I use my 840 with a stock MD-1 Microphone.. and get excellent reports on the audio Quality.....

Let me know if you have problems finding the mod... i'll try to find a way to e-mail it to you.........

Source record: 17376

I'm not sure where the resistor is supposed to go, but given that TR24 is the modulation limiter, I would suspect altering this part of the circuit will reduce performance. Handy Andy wrote some good thoughts about the modulator circuit a while back. I haven't tried his suggestions but they certainly appeared more sound (no pun intended) than the hack'n'slash mod's I've seen posted on the WWW.

Actually, this is a really good question. There are several aspects of the performance of amplifying devices that are worthy of matching. The gain is one, the conduction point is another and the E to C saturated on resistance is a third. I've heard a few arguments about matching based on these factors - but admittedly not for an RF applications.

But, I think the short answer is that if the dots match, you are gonna be just fine.

Sorry, don't think so: market's definitely there. Quite a
few out there already on 10m. It's priced low enough that
quite a few hams will shell out $150 pocket money "on a
lark" just to have a new toy. [Hell, that's what I did.]

I myself would've paid another $30-$50 if they'd put a
CW mode as well as CTCSS encode/decode on it.

The approx. $50 price difference (increase) of the HTX10
over the somewhat-similar $100 TRC485 CB compensates for
the relative sizes of the ham vs CB/consumer markets
(there's only a few $$ difference in raw parts costs).

based on how much work you want to do..if you dont want to change the tube sockets, you could run 8950's in there, but have to change the filament wiring to accomadate 12 v per tube instead of 6v.
you could also run 36kd6's, which are 36v versions of a 6kd6, so again you would need to put in some kind of transformer for 36v and re wire the filaments.

I hope this helps

>the help.. craig

The Yaesu 840 is a nice set-up... an all mode (USB/LSB, CW, AM, FM, & FSK), and it WILL do 11 meters (seems like a waste to spend this much $ to use it on ONE band though). The 840 has over 100 frequency memories/programmable channels and can work split frequency operation too. Optional filters can make it a real performer for it's price class and it IS controllable from your computer with the optional hardware. Power out is 100 watts SSB/CW, and 30-40 watts carrier on AM/FM.

I have the a Yaesu 900 in my car (the 840's cousin)... rugged and dependable.

BRAND NEW price is under $750 at AES (w/o the automatic antenna tuner) and a hand mike.

The 840 is modifiable to Xmit from 1Mhz to 30Mhz, see website below...

Thanks prozac. Could you also post or send me the next page of this sheet.
The page that shows the frequency chart in relation to the switch postions.
Also what do they mean that this mod. is for the newer frequency counter
148GTLs ?
The original mod as I recalled, utilized only 2 switches and no resistor. I
tried it but it didn't work. That's why I requested the info, to make sure I
had it right.
Thanks

If the driven element of an antenna is DC isolated from ground placing a 10K resistor from a low impedance point(usually feedpoint) to ground will prevent static charge buildup on the antenna.

It's time to replace my 1970s Radio Shack Ground plane base station antenna.
I will eventually get a beam (Maco 103HV), but for now I need a new vertical
for omni- directional use. I figure it's probably been discussed and debated
many times here,
but I need to decide which one is better for both 11 and 10 meter use.

For a while, Stu from Westgate was selling a transistor that was tagged a "477" but worked like junk. He quickly stopped selling them. I myself am not aware of any others that are direct drop ins and will do the numbers. The 2SC1945 (or is it a 1944 ???) has the same pin-out and is equivalent to the 1969 in terms of specs (or close to it). While it is easier to install instead of flipping the leads around, it is also more than twice the price. Not worth the "ease" to me. Sean

The BIG question is, are there any DIRECT replacements for the old 477/497's? I know there are some Japanese transistors that will "work" (after you swap collector and emitter leads) but they are of a lower power rating, and the radio will not do the numbers that it did with the 477/497. I have one spare 477 that I'm keeping just in case the one in my 2510, goes up in smoke.
I did up a President Jackson with a MRF 455, stud mounted to the heatsink. Lots of messy drilling, but it worked ok.

I just wish SOMEONE would market a direct replacement......

Source record: 17405

The Starduster has many advantages. It is the closest antenna to a natural 50 ohm impedance, is not reactive by nature, does not use any type of loading coil or matching network, has a relatively low angle of radiation, is broadbanded, etc... Many hams that do double duty as cber's use them for these very purposes. The biggest problem was that the Starduster was constructed of scrawny tubing and the vertical would tend to lay over or snap off in high winds. This is not to mention the support posts that held the ground radials in place cracking or breaking.

Much of the "hoopla" about the "magical 5/8 wave" antennas has been disproven or discreditted. Unless the 5/8 wave is mounted over a highly conductive surface (such as salt water, a very well laid out ground grid or highly conductive soil), the gain is not as high as expected. If you don't believe this, try asking the guys over in rec.radio. amateur antenna about it. This is NOT to say that they are not excellent performers, it's just that they do have some drawbacks.

These include: very long vertical radiator that is prone to damage in high wind areas, the need for some type of matching network to make the antenna a usable impedance for cb's, long ground plane radials for optimum performance, etc...

The testing that i have seen has shown that a 5/8 wave works best with ground radials that are 3/4 wavelength long. That's about 27 feet in each direction !!!! Unless they are ground mounted, they are too long for any practical base installation that i'm familiar with. Even if this was the case, you would lose quite a bit of performance by being down this low.

Please don't infer that i'm calling the 5/8 wave antenna inferior by any means. I'm just saying that there are a lot of variables involved with antenna design. A coathanger that is properly tuned and grounded can radiate effectively. Even a couple pieces of wire can be made into a center fed dipole that can talk around the world. I even have military books that talk about loading up TREES !!!!! This just goes to show that almost anything can be done if you have the skills and knowledge to do it.

Hi, Sean
You mean to tell me that the starduster is better than a 5/8 wave ground plane?I had heard that the starduster was a 1/4 wave with 3 radials, and have
always heard that a 5/8 wave had more gain than a 1/4 wave.Also I have heard the more antenna in the air the better.

How does the I-max 2000 compare ?

Happy New Year

Solid state designs being what they are, a lower impedance will typically produce greater current demands of the amp. This will in turn cause the amp to run hotter, reducing it's efficiency due to thermal losses. There is an impedance point that the amp will produce it's greatest output with the least current draw and minimal thermal losses. That is the point that we strive for and the industry has designated the target area of appr. 50 ohms or so for this to happen.

As i stated before though, not all amps / radios follow these guidelines and may load up more efficiently into different impedances. This results in a lot of trial and error to see what works best and loads up the most power. Than again, what loads up the most power may not necessarily radiate the most efficiently either. That's why people have been trying to find the "golden combination" for years and years. Sean
>

bg wrote in message <38668db5_2@news.sisna.com>...
Some simple facts to think about....The maximum power transfer occurs when the load resistance equals the source resistance. Under these conditions, the power dissapated in the source is equal to the power dissapated in the load. So max power transfer implies only a 50 percent efficiency. To pump 1 kilowatt into the antenna would mean that the transmitter is also putting out 1 kilowatt of heat. For best efficiency , the source resistance needs to be much lower than the load resistance. If a transmitter is designed for a 50 ohm load, it is not neccessary that it have a 50 ohm output resistance, in fact, the higher its output power, the more likely, it will be designed for efficiency rather than Z match. So it is entirely possible that by using a lower Z antenna rather than a 50 ohm antenna, you will get much more power up untill the point that the amplifier blows from overcurrent. The transmission line needs to be matched to the antenna,for max power transfer, but the transmitters output Z does not have to match the line.

I got so many emails on this one, that i'm going to say it here.

The quickest and simplest mod to the Texas line is this: Upgrade the power wiring going into the unit and replace the factory fuseholders with heavier units. Almost all of these amps are starving for power due to the resistive / thermal losses incurred by the scrawny wire and poor connections in the fuseholders. This is not a problem if the amp is not being pushed hard or is not loading up well into the antenna system.

For amps using multiple boards like the 400's, 500's, 667's, etc... make sure that you use the same gauge to both the front and back board. Texas uses the scrawny leg of a diode to feed the rear board and this not only chokes the amp, but also leaves room for a potential problem with an imbalance problem.

Don't ask for anything else. That's all your getting. That simple mod can be worth a few hundred watts under some circumstances. :) Sean

Right on, Dave. "Way back when", 36 - 40 was strictly ssb around the Chicago area. There was enough SSB activity to keep AM'ers off of those channels due to the interference levels. That is far from true anymore, and as Dave noted, most serious ssb'ers have escaped to the "nether world" of outbanding.

I can even remember a time when we wouldn't install upper channels into an AM radio. They strictly got the lowers and that was it. We reserved the high freq's for sidebanding. This helped cut down on the interference and gave everyone a place to go. So much for that theory :) Sean

Actually, in the areas that I've seen and read about, the SSB channels "officially" were 16 and 36-40. Not too much to ask. But as someone else pointed out, the term "gentleman" and "CBer" are not synonomous these days. Actually there are not many "gentlemen" left in society as a whole....

I doubt if you'll get much cooperation trying to keep a few channels clean for SSB. Too many people have the "If my dial has it, I'm gonna use it" mentality.

This is why a great percentage of SSBers have gone to the freeband.

If the antenna is mounted on a bumper, hood or trunk lid, it
may have a faults ground plane. Go by how well it loads
rather than the SWR. I had a 5/8 firestick on a S10 PU and
had to raise it 6" from its mount... It would not load or
match. The raising brought the base of the fire stick (NOT
the connect or the antenna mount) even with the hood and all
ws well!
Cheers,
John

Seattle area was 31 through 40,a couple years ago,what we hear on the DX,
every day comes out of the south, I realize that in unpopulated area's
people tend to run AM, and if needed to keep in communication the switch to
SSB, the AMer's on .365 sure tear us up up this way,

Source record: 17417

hi, I will be using a yaesu 840 radio with 25 watts am, and 100 watts ssb output, what output on radio would be safe to drive palomar 500, it has 4 - 1446 transistors in it, would it damage amp if you drove 100 watts pep though amp if it was off, (does it matter if amp is on or off). would you be better off putting a non amplified d-104 mike or a amplified d-104 mike on this radio, it has mike gain on radio. I have both, thanks for all the help you guys have given to me.... craig

I have a few old Johnson CB radios. One is a brand new Black face Messenger and one is a brand new Johnson 223 base with desk mic. The Black face is black tubed and has #12's swing mod (keys 4 and swings 40). The 223 is bone stock. Both kick butt.

Well folks looks like I am stuck at home for the day,
you name the freq and the time and I will be there. I can
operate in all modes (AM/FM/SSB). I am in the EST time zone
out of Boston, MA, just yell for the Major League Rainmaker.

Otherwise I'll be sitting on 27.555 AM with the ears on.

3981. Re: TRC Cb Radios

In my opinion, there is nothing wrong with the older 70's radio shack
radios. Certain models that is. There was a guy on this ng selling a
radio shack trc-458 base station for about 50-60 bucks in working order.
This might be a decent radio for a first buy.

My 2 cents.

why 27.555 AM? this is widely known as the international sideband calling freq. thats just what the world needs, another AM'er that doesnt go by the gentlemans agreement. why not listen where youll here more am'ers and wont cause trouble like 26.285 or something similar? just a thought.

Right, and the 2SC1969 is not a 45 watt device either (like the 477),
hence the problem. I guess that we're basically screwed if we want an
"easy" drop-in equivilent replacement.

Yup! That's the way it was. "Upper" channels were for SSB, and the "lowers" were for AM. I can remember many arguments erupting from SSBers trying to chase AMers (who had old Royce and similar radios with the 6 bit binary chips that did from channel 1 to 59 only) off of "their" territory. When confronted, the biggest comeback was usually "Who you gonna complain too, the FCC?". Eventually channel 50 became an AM calling channel of sorts. Once the skip died out, there were more than enough channels to go around, so the fights died down. Today it's pretty much anything goes, as I hear AM above 40 and SSB below 1.

Beam polarization on skip makes no difference. The polarity of the sky wave signal changes many times as it travels over long distances and can be of any polarity when it arrives at the receiving antenna, so whether both antennas are vertical or horizontal make no difference on skip. On signals via ground path polarization can make a difference.

Your comments are all right on Dave. The only observation that i would make is that the 5/8 ground planes probably had a measurably higher tip height. If you would have mounted the Starduster so that the tip was at appr. the same height as the 5/8 wave, you might have seen less differences in performance between the two. This would typically take about another 10' - 12' of mast to accomplish and would have gotten the Stardusters line of site well over the nearby rooflines. Sean

Hell now days down in Houston, it seems like the spanish speaking groups like talking SSB on the below freebands-and they like splitting the channels which screws people above and below one channel when talking on freq. This is also just as bad on the above freebands.

I know all legality is thrown out the window when talking above or below, but they could at least give some courtesy to people that have sense enough to talk on frequency.

Unit 712 is clear.

: CNHOPE1 <cnhope1@aol.com> wrote:
: I need some schematics for a class C amplifier(11meters).
: Thanks,
: Chris

Chris,

You don't want to run class C in your amplifier. Class C describes the amount of signal waveform the amplifier is working through (in simple terms). The same amplifier (in a practical example) can be class C, B, AB or A, it's just a matter of the control potentials (voltage) applied to the tube or transistor.

Since you probably want to run some type of modulated signal mode (am, ssb) through your amplifer, the practical class of service for most linear (a requirement for a modulated signal) amplifiers is AB. It's the real world compromise position between low efficiency/high fidelity A and almost making it to Class B where the distortion of your signal is too much.
Class C would be really distorted and dirty, probably unusable for the most part and very poor operating practice.

So your standard amplifier circuit can be biased for class C, but the end results are very bad for voice (linear) signals. Moving the same amplifer up toward AB bias positions will allow it to work and sound the best it should. If you have a specific question, feel free to Email me direct. I'd rather have you run a clean, clear and loud signal to my radio vs a class C signal to my TV/VCR.

cheers

Come on now Toll Free... you ought to know better than throwing out a statement like that. For the most part, you can get away with similar transistors, but in a marginal circuit where the transistors are pushed hard and hot, unmatched transisitors are trouble waiting to run away. Especially if the amplifier doesn't supply heat adjusted bias tracking. Most mobile CB linears don't. Get some of those cheapo solid state amplifiers good and warm and they'll go into thermal runaway in a long winded conversation. But we all know no one ever gets long winded...

Not even close to true,stacked verts made from just coax can have a
lot of gain,I made a 72'er once out of RG8X and even though it was
barely off the ground 5' it blew away my A99 at 72'.
Other ways to do it as well.

True but an antenna with 3.3DBD would only have 5.6DBI.Maybe it was a
typo but your post said "DB" which is meaningless in this context.

My radios all come with an incredibly powerful option. It's a switch
labled "power." The amazing thing about this switch is that if I hear a truly
moronic individual on the air, as I did last night around 3.9851 Mhz (Hello
Dave), all I had to do was pull that switch to the "Off" position, and all his
ramblings disappeared! Oh wait. I forgot, I have another option installed.
It's called a "life."

yes and no... as if you werent expecting that kind of an answer?

Yes, they will work in your amplifier, but not without some rewire of the
sockets and a bias value change. So, in practicality, it's not simple to
do and the cost benifit above finding NOS tubes is out the door.

cheers

I have a problem with the amp not keying up at all. The radio is working fine, but when I key the linear, nothing happens. It is getting plenty of electricity to the box. Something that I noticed that seemed a little strange was that when the radio was keyed up, if I pushed in the preamp on the linear, the meter on the radio would move from about 7db output to 30+. The only thing is that the preamp isn't working on the linear, matter of fact, nothing is. Could it be a relay?

Any suggestions? The radio driving it is a Galaxy 2100.

Thanks,
Bossman

But this rarely happens in a Class C grounded base circuit, or if the circuit is being barraged with RF drive. That was my point.

> Especially if the amplifier doesn't supply heat adjusted bias tracking.

Very few amplifiers today even offer bias! When the RF drive is removed, their is NOTHING on the base, and the only time the base is turned on is over about 40 percent of the input cycle!

> Most mobile CB linears don't. Get some of those cheapo solid state
> amplifiers good and warm and they'll go into thermal runaway in a long
> winded conversation.

Not the no bias ones.... Takes a high SWR to get a DaveMade, X Force, Cookie or one of the other proven battle box designs to go into runaway.

But we all know no one ever gets long winded...

hehe

What your saying is right about using a Texas Star or Messenger (or one of the other handfull of amplifiers that have bias applied)... But the no bias amps that are getting clobbered with drive (their are quite a few people running 300 watts or so into a 4 transistor amp (2X1446 into 4X2879 or a single 2290 into a pair of 2879s...) and they run no bias... This actually helps the circuit not have to have matched transistors in it.

For an AB amp, yes...

For a C amp... no.

Yes, it would, but how many radios out their use push pull for their dual finals?

Most just parallel the outputs.

Replace the PNP transistor next to the relay. Do NOT use more
then a 2 watt dead key. Turn box off if someone is near you and
it starts buzzing.

>
> Hogwash.

No its true. Hams contacted Ebay about people selling illegal 11 meter radio gear. The post I read stated that if Ebay did not pull the auctions then all of them would be forwarded to the FCC. Ebay even had a disclaimer on there web page from the admin pertaining to this subject. It stated: It has come to our attention.......... It went on to say that they would pull any and all auctions of illegal contra ban including linear amplifiers. They had to post that message. They pulled over 1000 auctions. Allot of dedicated Ebayers where upset and they wanted an explanation. If you don't believe me than do some research with Deja news.

> What _ATTACKS_ are you talking about?

Explained above..

> Where did you read
> that is was a group of Hams that _THREATENED_ Ebay?

On Ebay's web site and on this group.

> What exactly did
> they threaten Ebay with?

Explained above.

> And what makes you think it was the ham
> operators that frequent this group?

From the posts that Hams put on this group. Back when this first happened Hams where all over this group talking about it and rubbing it in. Its all true and its all on Deja News so go do some research. The thing that is bad about this is that this news group is for CB'ers. That's why its called Rec.radio.Cb. Why do hams come to this group and try to bash us and Cb? Because most hams started out as CB'ers and they miss it but they do not want to admit it..

Just the facts..

4046. Re: Co-phasing base vertical antenna - any good?

Newsgroup: rec.radio.cb
Date: 1999-12-28 00:00:00 UTC
From: -=PEAKABOO=- <peak-a-boo@mindspring.com>
Message-ID: <84bh1m$p6r$1@nntp5.atl.mindspring.net>
Source record: 17493

You could try phasing these two antennas 180 degrees out of phase and see what happens, if you space them a 1/2 wavelength apart you could use a peice of coax to each antenna but make sure that the antenna that is in the direction you want the most gain is fed with a 1/2 wave wave more in length of coax, you must figure in velocity factor on the coax which would make the forward antennas coax about 12 feet longer the the back antenna, I believe this would work with 50 ohm coax and you would need a tee connector, and I would not run a lot of power through a tee connector (more than 500 watts).

You can make texas stars apear to do BIG watts, But if you had enough power supply you might be suprised at some of them will do, I just dont agree with their 1" XFMR's and don't see how they could do very good with them, I believe that they need something a tad bit longer, not a whole lot but a tad.

the 148GTL already comes with variable modulation (dynamike),if you mean variable power..you need to decide which method you are going to use...i would use the swr cal so you dont have to drill.

Uhhhh, Graeme, what KIND of antenna are we talking about? Mobile with
a stainless steel whip? (get a file or hacksaw, because wire cutters ain't
touching that stuff) Is it a base antenna with sliding aluminum tubular
sections? (get a drill and make a setscrew hole in the inner section). It is
a beam or other type with a matching network? (stumped on that one, but then
again, you said you were trying to SHORTEN the antenna). Is it a helically
wound fiberglass antenna? (saw it off, seal the end with silicone, put a
rubber cap over it)
Oh, and are you sure that there's nothing wrong with the meter with
which you are checking your SWR? I had a meter here that appeared to read
correctly (would go full scale to calibrate, varied readings with tuner
adjustments, the whole nine yards) but when checked against several other
meters showed a flat SWR reading when no fewer than four other meters were
showing exessivly high SWRs.

Yes, the tubes are being discontinued, however, the amplifier also uses the 572B, which is not being discontinued, rated for about double power dissipation and drop right in!

So, if you are looking at the Ameritron (or another amp with 811As), keep that in mind.

This sounds like the positive lead trace burning up..

Common problem to amps that have any amount pressure put on the front panel... The shorting bar that holds in the switch banks can come in contact with the B+ rail feeding the switches.

Do you get any lights when you push the switches? (I am assuming you checked the fuses already)...?

>>>and I said it was holding 17 grand where?

>>>I hope this doesn't attempt to be a "I can put words in his mouth"
contest.

I am sorry i refuse to
> believe you can see more watts per pill with a 32 than you can with a 2
pill
> or 4 pill etc.

>>>Then you need to get Dave to teach you how to build a decent combiner
because the ones you are using are shit.

>>>Sorry, but that is plain and simple. If your combiners are THAT lossy,
that you see major wattage differences, then you have problems that need to
be ironed out.

17,000/32= 531.25 watts per pill lets assume you meant a 64
> pill . 17000/64= 265 watts per pill

>>>And if that was all a 64 pill was doing, I would throw it away.

>>>Hell, your 32 pill does 13 grand at 20 volts.

>>>And every time you halve the voltage again, you get another double in
power... SO... Increasing it 25 percent would mean what? A 50 percent
increase in power... SO a box being hit with 25 volts would do what
ACCORDING TO DAVEMADE???

>>>It would be right around 19 grand.

>>>Thank you. I don't think you can dispute ohms law? Or has Dave gone
above Ohm?

>

Bite the bullet and invest in a Wilson 5000. It's a better antenna and no capacitors to blow. Search the web for some of the hybrid mobiles out there. At the moment Flatline antennas is all that comes to mind, but there are others. I can't speak from experience concerning the hybrids but being a former K40 user, I've found the Wilson to be a better performer.

How can the "Y2K bug" affect something that doesn't have date coding in it's program? Granted, it has been a few years since I graduated, but isn't the big bad bug is a date code problem? How can it affect non-date coded products like CB's and cordless phones? Isn't the media induced mass hysteria over this problem bad enough? PT Barnum was right. Sorry group, just needed to vent.

'TWAS THE WEEK AFTER CHRISTMAS
AND ALL THROUGH THE HOUSE
NOT ONE PC WAS WORKING
NOT EVEN A MOUSE.

I TURNED ON THE POWER
BUT NOTHING WAS WORKING
I GRAB THE COMPUTER
AND START BANGING AND JERKING.

I LAID OUT THREE GRAND
FOR THIS BIG PIECE OF JUNK
ON JANUARY 1ST
THE DAMN THING WENT "KERPLUNK"!

WHEN I THREW IT OUT THE WINDOW
IT MADE SUCH A CLATTER
MY NEIGHBOR JUST CALLED
TO SEE WHAT'S THE MATTER.

I TURNED ON THE TV
THE CABLE IS DOWN
MY MICROWAVE OVEN
IS MAKING WEIRD SOUNDS.

MY NEW VCR
IS AS DEAD AS A ROCK
NOT ONE LIGHT IS BLINKING
NOT EVEN THE CLOCK.

IT'S TWENTY BELOW
THE PEAK OF SNOW SEASON
THE FURNACE WON'T WORK
THE PIPES ARE ALL FREEZING

THIS COULDN'T HAVE HAPPENED
AT A WORSE TIME
I THINK I HAVE FROSTBITE
ON MY BEHIND.

I LAUGHED FOR A SECOND
AND THOUGHT IT ALL FUNNY
THEN A CALL FROM MY BANK
IN REGARDS TO MY MONEY.

"WE MANAGED YOUR PENSION
AND SAVINGS WITH CARE

BUT FOR SOME ODD REASON
YOUR MONEY'S NOT THERE
WE WERE Y2K READY
WE'D THOUGHT WE'D BE HEROES
BUT REGRET TO INFORM YOU
YOUR BALANCE IS..ZERO"!

I DROP THE RECEIVER
TO THE BATHROOM I RUSH
I PUSH DOWN THE HANDLE
THE TOILET WON'T FLUSH.

I TURNED ON THE FAUCET
NOT ONE DROP HITS THE SINK
I HEAD OUT THE DOOR
TO THE PUB FOR A DRINK.

I JUMP IN THE CAR
TURN THE KEY IN THE SWITCH
IT ONLY GOES "CLICK"
I SCREAM,"SON OF A BITCH!"

A COMPUTERIZED IGNITION
HAS JUST SEALED MY FATE
NOT SET UP
FOR THE "2000" DATE.

I TWITCH LIKE A MADMAN
THIS CANNOT BE TRUE
NO CAR, HEAT, OR MONEY
WHAT THE HELL CAN I DO.

SHOUTING OBSCENITIES
AS I RAN OUT OF SIGHT
HAPPY Y2K TO ALL
IT'S BEEN ONE HELL OF A NIGHT!

129 Said it damn glad I did!

What do you mean "you don't rag cookies or stones" ? I don't understand
that statement.

As to the Texas amps, i feel the same way. While they are using a different
blend of ferrite than most anybody else, it still saturates pretty quickly
due to the lack of core material. I hope to have a solution that will also
greatly increase power output not too far down the road. Sean
>

Source record: 17514

The problem is not the operator in many of these cases. I get a ton of radios from the Hispanic community. Most of them have been poorly mod'ed and the clarifier was never properly aligned. They are transmitting and receiving where the radios will lock onto each other, which is typically pretty far off of center slot.

The idiots writing these "modification manuals" and posting "tune up tricks" on the web never take into account the offset involved between adjusting the RX and tx frequencies in the various modes. Then, the next idiot, following the first idiot's directions, incorrectly installs the slider and leaves the mess for someone else to deal with. This also goes for the numbskulls that use "expo kits" on SSB radios too.

Just because you can follow directions to modify a radio, does not mean the directions were right in the first place.

Just because the lights come back on AFTER you've worked on it does not mean that the radio is working properly. Sean
>

David P. wrote in message ...
Hell now days down in Houston, it seems like the spanish speaking groups like talking SSB on the below freebands-and they like splitting the channels which screws people above and below one channel when talking on freq. This is also just as bad on the above freebands.

I know all legality is thrown out the window when talking above or below, but they could at least give some courtesy to people that have sense enough to talk on frequency.

Unit 712 is clear.

If you want to keep the antenna then Cut about 1/4 inch off of the top with a dremel tool or hack saw. Make sure you keep the cap in place while reading your swr. Do this until you get the desired swr or the best you can with the antenna. I tune lots of antenna's. Some antenna's are from radio shack.

Anyone know where I can buy those big barrell mic plugs? Those cheap small looking ones that Copper sells isn't going to do it for me.

> How do you tune your antenna and CB?
> Where can we find moron free info?
> Any help is greatly appreciated.

Okay, Daniel. A quick lesson in antenna tuning. For an antenna to operate effectively (maximum tx power radiated), it has to be the correct length for the frequency. One way to insure this is to use an SWR meter.

Typically, the meter is attached to your radio using a short piece of coax and the coax for the antenna attached to the other connector on the meter (the manual with the meter will explain how to use it).

For CB, the radio should be tuned to channel 20 for all readings (assuming that the radio has 40 channels). Once you have the antenna tuned properly for channel 20, turn to channels one and forty to make sure the meter readings are still acceptable.

The antenna is usually adjusted by physically changing the length of the antenna. This usually means loosening a small screw on the base of the antenna, sliding a section of the antenna up or down, tightening the screw, and then taking a reading on the meter to see the effect. This process is repeated until the right length is achieved to get the lowest reading on the meter.

Some antennas have other methods to adjust the length - a screw elsewhere on the antenna, tuning rings, etc. (read the instructions that came with the antenna).

It should also be noted that the antenna length may also have to be adjusted to compensate for items in the general area that interact with the antenna and affect the performance (other meter objects, for example).

Anyway, the final goal is to get the lowest SRW reading on the meter. In many cases, it is not simply possible to get a perfect reading (the lowest point on the meter), but you should attempt to adjust the antenna until you get the lowest reading possible.

Hope that helps.

Yes, you can use the radio to monitor others. However, do not
transmit until you have your license (especially in the ham bands).

In the future, you may want to check out the Amateur Radio newsgroups.
Here is a list of newsgroups that are carried by most servers...

MC, you misunderstood my message. I was not objecting to the facts - I was objecting to your choice of words. The fact that certain people pointed out to Ebay that it is illegal to sell amplifiers designed for CB use, or that the ads would be reported to the FCC if they continued, does not constitute an attack or a threat (you used both of these words in your message).

And there is no evidence that it was anybody in this newsgroup that contacted Ebay (a claim made in your message). Since Ebay has not stated who contacted them, you are basing your claim, that it was ham operators, on pure speculation - you have no facts to prove that.

> The thing that is bad about this is that
> this news group is for CB'ers. That's
> why its called Rec.radio.Cb. Why do hams
> come to this group and try to bash us and
> Cb?

I cannot speak for the other ham operators in this newsgroup, MT. However, I continue to use a CB to talk to my friends that do not have a ham license. And I use my ham radio to talk to my friends on the ham radio bands. Therefore, I'm both a CBer and a ham operator.

As for your complaint about people bashing you, perhaps it is because you post messages that based on wild speculation without any facts to back up your claims. When someone challenges you to back up your comments, your defense is to claim that they are bashing you.

Spike wrote:
>
> I have a 1999 Frieghtliner, with the plastic mirror and the antenna mounts
> in the mirror. Is there a way to ground them to get my SWR down a bit.

Spike, you could try attaching a short grounding strap directly to the antenna mount and the other end to a metal part of the truck. This may get the SWR reading down a bit.

However, a better option, if you want to continue using an antenna mounted to the mirror, is to use an antenna that requires no groundplane. These are widely available for wood, plastic, or fiberglass, vehicles such as boats, RVs, or vans. For example, Radio Shack sells one that should attach easily to your truck mirror (item #21-977). A version that clips onto the window is also available (item #21-983).

Another option is to move your antenna to another part of your truck that has more metal available. In fact, it you wanted to place the antenna directly on the roof of your cab, you could use nearly any mag-mount antenna (such as the popular Wilson).

I'm not thrilled with all the plastic parts they're sticking on vehicles today. It may be cheaper for the manufacturer to make the parts out of plastic, but these plastic parts never last as long as a good metal part (which means we have to spend money to replace these cheap parts as they quickly wear out).

Here are a couple I've come across:
HY Electronics Catalog
Left Coast CB Radio and Amateur
R&L Electronics
Bernie's CB
T.C. 2 - Way Radio
A1 TELECOM
Pacific CB Radio Sales

I've ordered a few things from Copper, no problems.
Copper has pretty good selection.
I have paper catalogs for Copper, R&L, and HY.
All 3 seem to have similar prices. I think HY has a bit more selection, in
the printed catalog at least.

Source record: 17532

Hi,Again Sean,
I have a starduster that is 20+ years old.I had to make a new bushing for the radiator,thats the reason it was taking down.Any way I repaired it and put it back up, but I don't have the supports for the radials.It's been up for 6 years now and have had no trouble from it.The match is 1.1 to1 across all 40 channels,with a slight rise at each end of the band.
To compare and look for a better local signal,I put up an old avanti 5/8 Ground plane.Both are at 30feet,and 45 feet apart.Reports are the 5/8 is better without anyone knowing witch one I was useing.Anyway,I want one higher,in a tree perhaps.I was considering getting a new antenna to put higher,but if the starduster is equal in local perfomance to a 5/8wave I can put it up instead.I will not put the 5/8 ground plane in a tree because of the radials.At my location the 5/8 seems to out perform the starduster.Thanks for your time,and help.
Happy New Year

811A tubes as well as 811 standard tubes, (in vertical mount, should make
little difference) are still available via Svetlana, a Russian manufacturer
(there are also Chinese 811's). They are quite cheap as compared to other
RF amp tubes (less than 1/2 the price of the 572B). Contact Svetlana
on-line for info, but I've heard nothing about them discontinuing the
line... the 811A (as well as most other tubes), are no longer manufactured
in the US.

I had a similar problem on a Suburban... the mirrors were insulated from the truck chassis by plastic mounts. I ran a short piece of wire to body of the truck (anything'll do that has electrical continuity with the body) and the antennas tuned perfectly.

Another option is the 'no-ground-plane' antenna, but I'd try the piece of wire first. It's cheaper (you already got the antennas) and the no-plane antennas generally do no not perform as well (especially when you've got a Semi-size ground plane to offer!).

Rob...
Sure can! There's no license requirement to purchase or own a piece of amateur gear. (I believe many amateur stores WILL check for a license before selling a linear, though) The 757 is a nice rig, I think you'll be very happy with it. Yaesu has a good name for durability.

Actually, I think most of the CB op's using ham gear do so because they're looking for a better reciever... Most CB's are single conversion receivers, whereas most Ham rigs (NOT the single band 10m rigs.. Ranger, Uniden, etc) are double and triple conversion receivers offering far superior selectivity and sensitivity as well as filter options, unavailable in CB rigs. The fact that most Ham rigs do 100 watts SSB off-the-shelf doen't hurt either (30-40 watts AM).

Correct. Motorola color dots based on beta range. As long as the same dots are
used that is fine. While beta is important for biasing purposes, it is not a
true indication of RF gain. Other factors in the construction of the bipolar
transistor affects gain as well as outside components are a more a determination
of gain. Especially the later.

If you run resistance across Tr24 it needs to be ran from the middle leg. this is a tricky job as you have to extend all of the legs to get it to go back in. I have done this on my madison and did not see any appreciable difference than leaving it alone or for that matter taking the mod limiter right out of line. 10 to 1 half dozen to the other. But yes I have seen this done to radios before and I am not sure what the true gain is. TVI is not going to be as bad asit would be if you took it out.

Hi,Dave
Thanks for your response.I have both amplified and non.I wired the non amped mic,and it sounds real good.I had someone else talk too me on it.The radio is solid state and is supposed to have a mic impedence of 500 to 600.I would prefer to use the non amped mic,but am I missing something without matching it up ?It sounds really good to me, - clean,clear and in my opinion loud enough.
Thanks for your help,
Happy New Year

4141. Need to shorten antenna, more details...

Newsgroup: rec.radio.cb
Date: 1999-12-29 00:00:00 UTC
From: kyzyl@geocities.com
Message-ID: <38697b10.99620119@news-server.columbus.rr.com>
Source record: 17590

The CB is a Uniden PC76XLW, and the antenna is a cheap-assed $30 40" fiberglass magneic mount job from Radio Shack.

The SWRs at ch1 show about 2:1, but at ch40 it's 3:1

I tried moving the magmount around on the roof (fullsize bronco with metal cab roof but fiberglass 'cap' roof at the back) to no effect.

It says on the antenna package "Do not shorten the cable, it is measured for optimim performance on the AM CB bands" It has a lot of spare coax which I've zig-zagged under the carpet from the entry point (passenger door) to CB mount position (center console)

So, it seems to need a shorter antenna, but short of actually cutting the fiberglass or reducing the length of coax I'
m not sure what to do.

I was thinking about measuring the adjustment range (about 4") and cutting that off the top. That means I could move the adjustable section to the 'long' setting and it would be the same length as right now. That would give me another 4" of shortening available... Does this sound like a good idea, or am I making an idiot of myself by even suggesting it?

Thanks again!

: I think it's a good structure. Perfect? No, but would someone please
: describe a perfect structure?

The only difference I would have had is 4 classes. A Novice class for entry to HF (CW requirement) and a Tech class (No CW). The General and Extra classes would both require CW testing.

This would allow entry into Amateur radio without a CW requirement, if that is what a person desired. It would also allow a low technical knowledge entry (Novice).

I would also have gotten rid of the question pools, and stiffened up the questions.

I assume that you're referring to the header information - the
subject, date, from, newsgroups, etc. That is an option that is
available either in the preference settings, or under a menu on the menu
bar (under the view menu, for example). Look for the word "headers" and
turn this back on.

That is total nonsense, Bill. Even a child can pass an Extra exam,
including the morse code test. Many do. What does that prove? If we
apply the standard you use above, it proves that no knowledge is
necessary to pass the Extra exam, or that no knowledge is required to
learn morse code?

Went away over Christmas and lost your post from my newsreader.

I think it was yourself that asked about our PDM AM modulator in the class-E PA.

In answer to the question 'Are you modulating the FET's using a big audio PA'? The answer is no.

It's not a linear audio amp. I have a friend in the low power AM broadcast game that's considered this route. Basically it's very inefficient. To establish the carrier DC term the chip is biased so the output is halfway between the supply rails with no audio input. In this situation one half of the chip output pair is passing the same current as the RF final with half the total supply volts across it and producing nothing but useless heat dissipation.

With a Pulse Width Modulator is a series pass element which is a saturated switch , and placed in the supply or return of the final RF stage.

The technique is very similar to that used by some of the audio amp people for hi-fi purposes. Rather than typing up the whole of the operation of a PWM may I suggest you take a run over to the : AM Bulletin Board web site.

If any of the shoot-out crowd want pure power in class-C then class-E would be a way to go especially if you do it on a big bottle like a 4CX5000. Someone in a mail reckoned on >30Kw for one...

Starting April 15th , 2000 the Morse Code test is only 5WPM (words per minute) for all classes of Ham radio licenses. Also beginning then the written tests are reduced from 6 to only 3. Join the rest of us who enjoy real world-wide communications with as little as 5 W of power. I mean no disrespect to CBr's as I was once one myself in the 70's but once you taste the legal Ham bands you'll never regret getting your Ham ticket. 5 WPM is a very easy goal to achieve. Start working on your code speed now and you'll be all set . Shortly the question pools will be available for the 3 written tests. Technician,General,and Extra. WE want more hams in the ranks..you are all very welcome to pass the tests and join us ..... see you on the bands! (legally)

Bill:

Admittedly, I am one of those amateurs of which you speak. I hold an extra class license simply because of my ability to memorize the entire question pool and one lucky guess on the multiple choice code test (knew 6 of the answers, guessed one out of four on the remaining ones). Still, you can't memorize the question pools without learning something.

I would say "amen," especially to #3, but the problem is that most of the guys who overdrive transmitters and cause splatter over a 20 KHz bandwidth already know how and why to avoid doing it -- but just don't care.

I sure don't see a problem with the changes. We now have
CB'ers in the 10 meter band, we have Generals, Techs and
Advanced operators in portions of bands there not supposed
to be on. We have all classes of operators in violation of
the rules everyday of the week. The problem here as I see it
is the same as its been for years, "ENFORCEMENT of the
RULES" We have groups of hams that seem to think they own
some frequencies. We have groups that cuss and swear on the
bands. We have groups that if someone gets within 3kc, go to
that frequency and try to take over. In my years of being on
ham radio, it sure seems to me the Advanced and Extra class
have the worst operating habits on the HF bands. And of
these poor operators many were CB operators at one time and
were rude there, ran big amplifiers, had to king of the
band. They came to ham radio and continue to have to be
king of the band. This is the way I feel about it, If you
feel other wise that's fine. Bill/KG8AW

Guys like you said the same thing when they enacted "novice Enhancement". I remeber the old farts selling off their 220 gear, because they didn't want to associate with novices. Life went on.

Guys like you said the same thing when the no-code tech came out. "Those no-coders are not "real" hams". Life went on.

Now we finally are recognizing the pointlessness of requiring advanced CW simply to access phone HF, and of course the old farts will whine about the doom and gloom that it will bring.

As far as I'm concerned, ham radio is much better off without guys that cannot accept people for who they are and not what class of license that they hold. I sincerely hope that this FCC action causes a lot of old stuffed shirts to sell all their equipment and throw in the towel. More room for the rest of us, that truly want to see ham radio progress, and who don't have a close minded, bigoted, and predjudicial attitude.

The real joke here is that you won't be able to really tell who the
so-called "real" hams are after a while, so you might some day end up
finding out that your best ham buddy never took above a 5 WPM test. What
will you do then?

The only reason that I respect the older hams, is that they are usually
the most knowlegable. Unfortunately, they are often times the ones with
the most stuck up attitudes, with regard to "modernizing" the service,
and acceptance of "new" people.

> While Morse code is not my favorite nor do i know it, i do feel that one
> SHOULD have to be quite proficient at reading and sending it to obtain an
> upper level license. After all, it is the most effective means of
> communication that we have under adverse conditions. It also knows no
> language barrier and is therefore universally accepted.

While it is true that Morse can "get through" under adverse conditions,
it is also true that CW is nothing more than another mode. Like SSB, AM,
FM, RTTY, etc. There are no "special" testing or considerations given to
any of these modes, and no ham is required to USE CW, so the testing for
it should also not be mandatory. It makes no logical sense to require
demonstrating CW proficiency in order to gain greater HF voice
privileges. If one is truly interested in exploring the advantages of CW
communications, then it should be their CHOICE.

The main reasons that the "old farts" in the ham community hold on so
tightly to the CW test is simply because:
1. They believe that it keeps CBers and their "ilk" off of the ham
bands. (their words)
2. They somehow believe that it "builds character" (whatever that means)
3. They fear that elimination of the test requirement will lead to
abandonment of the MODE, and they will lose people to communicate with.
4. While they won't admit it, they believe that it's a right of passage
or "if I had to do it, YOU have to do it" or you're not a "real" ham.

>
> As to the "old ways" dying out, that would be a real shame. The old timers

> knowledge & skills to do it.

I could not agree more with the homebrewing aspect of ham radio.
Unfortunately, today's technology precludes the ease and ability of the

average ham to homebrew more than the simplist radio. Trying to
duplicate an Icom 706, with radio shack parts would be beyond just about
anyone's capability.
Even great kit builders, like Heathkit, folded simply because it's
cheaper to mass produce a rig in south Asia, than it is to kit the parts
for one for someone to assemble here.

In 1945, it was fairly easy to duplicate the state of the art technology
at home. Today, this is no longer true.

That being said, I am also dismayed at the "dumbing down" of the average
ham. Most can't even work on their rigs let alone design and/or build
one.

But even though there seems to be a decline in the knowledge base of the
typical ham, it has nothing to do with CW, or requiring one to know it.

> How can you say that we would be better off without mentors that actually
> understand what they are doing and do it ? Instead, we will be left with a
> bunch of numskulls who read a book and know just enough to pass a few
> written tests. How does that rank ???

I agree, but again, it has nothing to do with a CW test. If you want to
raise the technical standards of a ham, then make the written theory
test harder.

>
> The REAL hams are the ones that know theory, but also have tons of hands on
> experience. These are the folks that i want around when i need help. Not
> the newcomer idiots running around on 2 meter repeaters playing "radio
> operator".

Again, no relevance to requiring CW testing.

>
> Just because times change doesn't mean that they have changed for the
> better. Lowering standards is a liberal thing that none of the people that
> have worked hard to achieve their status believe in. I don't blame them.
> This goes for all facets of modern day life, not just amateur radio. Sean

I agree wholeheartedly. But you have to be able to differentiate between
a blanket "lowering" of standards, and mearly changing the standards to
fit in with a modern world. CW was "the rage" when the Titanic sank. So
why, in this age of emerging digital communications, computer networks,
and even advanced analog modes, are we still forcing people to learn a
100+ year old skill that has virtually no other use in the commercial
world, and only limited use in the ham radio world?

If I would have had my "druthers", I would have dropped the code, and at
the same time changed the theory test(s) to one that can no longer be
simply memorized. That would have "changed" the focus and standards, and
IMHO opinion actually raised the bar for admittance.

The simple reality is that ham radio is dieing as a hobby. Computers have captured the imagination of the young people today. There is a lot to do on the internet, and it requires no testing at all. If ham radio is to remain competative in attracting people to it, it has to lose some of those stuffy old paradigms, and embrace a more modern appearance.

Since the no-code tech license became legal, the applicants for the
novice license simply dwindled. There is really no need for a novice.
With the addition of the 5 WPM CW, you become a general now, and with
only a small increase in theory testing from the original novice.
Remember the FCC's REAL intent was to simplify administration for them.

>
> This would allow entry into Amateur radio without a CW requirement, if

> knowledge entry (Novice).
>
> I would also have gotten rid of the question pools, and stiffened up the
> questions.

Alot of people had suggested that. For whatever reason, the FCC rejected
that proposal. I guess having no standard published question polls would
have made it harder for them to administrate.

While I am grinning from ear to ear that CW has finally been
de-emphasized, I do agree that the the FCC's motives seem to be more
along the lines of releaving them of administrative burden, than it is
to "improve" the ham radio service.

I am going to take the 20wpm test next month before it's gone. But, I think
the change in requirements was a good idea.

But on the other hand, considering the price that they charge for new
"export" type CB radio's like the Galaxy Saturn Turbo, a second hand
Yaesu becomes price competative and is a much superior radio in both
transmit and receiver performance.

Yes, most of its band capability would be "wasted", but from a cost
competative standpoint and from the perspective of the serious SSB user,
it makes sense to use a HF ham rig.

Another good point! And one that I can personally relate to. In the late 70's I had a guy up the street who got into freeband SSB. His first attempt was with a modified 23 channel radio with a VFO. When he was "upstairs", he used to throw out all sorts of hash on the lower 23. Eventually he sold that rig, and bought a Kenwood TS-520. The rig had more power output, but I never heard more than a faint change in background noise when he used that rig. Much cleaner.

The higher values have too much others factors such as inductance
involved. The capacitor is not strictly just a capacitor.
This is why SMD technology needs to be employed at higher frequencies.
The virtually non existent lead lengths make the capacitors real
capacitors.

Source record: 17641

The first harmonic of the 27MHz CB band falls right in the low end of the TV broadcast frequencies, channel 2 I think? Anyway, Reducing the first harmonic by using a low pass TVI filter will help but, if you are overdriving the amp you are probably generating a square wave output which is full of harmonics. Also, even if you have a clean signal but just a lot of power, any device that has components that act like a diode will detect the AM signal. When I was a kid I used to have a powerless radio that had just an earplug, a diode and a small antenna that slid up and down in a small coil for tuning. The local broadcast stations in Chicago put out enough power for that little device to detect an audible signal. You sometimes find that even a clean signal is heard in stereo equipment, phones, etc.
Have fun and good luck. Oh, try using a power line choke on the equipment that is detecting your signal if the TVI filter doesn't do the trick.

Um, I think if you are driving a non-50Ohm load with 50 Ohm coax, a 1/2 wavelength of coax at your operating frequency will -reflect- the actual VSWR at the feedpoint. Not a quarter wave length.

Greetings!

Heck, just change C102 to 220pF or if too loud, try 0.0022uF [223]
then also change R127 to 3.3K.

Leave TR24 alone if you use SSB - you'll need it to help control audio
drive.

See my post "Re: The Key to Crystal Clear Audio" some hints in there
to refer to what you're asking here...

While Dancing with the Mouse on 28 Dec 1999 01:01:40 GMT, the Modem
interrupted with an MNI from "jayedie11@aol.com (Jayedie11)", and the
MotherBoard buffered this to Video RAM:

:+> What do you guys have to say about putting a 1.5k resistor inline with tr24,is
:+> it a good idea or bad idea and why?
:+>
:+> ps-does it open up TVI/RFI?

Regards!

NEWINGTON, CT, Dec 30, 2029

"We believe that an individual's ability to tune a radio, display any
knowledge of antenna theory, radio theory or general electronics theory,
is not necessarily indicative of that individual's ability to contribute
to the advancement of the radio art. Therefore, all future tests shall be
based solely on payment of the appropriate licensing fee, whose amount the
individual will need to memorize from the sheet provided to the individual
during the testing session, and to then write a check in such amount
payable to the FCC. Those who successfully write a check in the
appropriate amount shall be licensed, and shall join the long and proud
community and heritage of the Amateur Radio Operating Community."

Um, not exactly. The sun is an isotropic radiator - that is of course if you
believe in the wave theory. :->

> But getting back to the question at hand, NO...I
> do not believe 'co-phasing' a base OMNI antenna would make much difference.

Won't really argue this. The size of an 11m vertical doesn't make it practical
to mount one atop the other. You could put them beside one another and achieve
some additional gain in two directions though. Or, you could feed them
out-of-phase to improve the directionality in one direction. In my opinion this
is pointless due to much better antenna options (read: beams) being available
for directing one's signal.

> If it did, EVERYONE (cops,government,radio stations, T.V. stations, and even
> HAMS) would obviously be doing it. So....the OFFICAL answer is NO.

Um, I hate to tell you this. Actually, I don't. :-> Every TV and FM broadcast
antenna I've seen is comprised of two or more antennas that are indeed
(co)phased. Most AM broadcast ones are also - but I have seen exceptions here.

> can always waste your money on the 'latest' C.B. antenna claims.
> Hell...just put 75 ft. of RG-8X in your backyard as an 'antenna'. Surely
> SOMEONE will claim that it has as much gain as a three-element beam! LOL...
> :>)

Hee hee....actually, if you had scads of room (vertical) you could indeed make a
rather efficient omni antenna with some coax. Hard to explain, but I'll try. If
you pealed off a quarter wave length of shield, then left on half a wavelength,
then pealed another half wave then left another half of shield and then pealed
off a final half wave. Double back the pealed shield over the un-pealed(and add
a little due to it ending up shorter) not joining the two pealed back parts,
then you would have a monster about 83ft tall. If you could suspend this in some
wave (large wooden pole?!) you would in theory have an omni antenna with about
7dBd (9.15dBi) of gain.

If someone is truly interested, I will draw a picture. Email me.

I think that a successful examinee would really deserve the license
if one of the questions was to derive Maxwell's equations and a second
was to use the equations to derive the properties of waveguides. What
I'm saying is that it's not the number of questions it's the quality
that counts.

i noticed that you can put a 10 KC switch on the 8719 chip. well insted of putting this 10 kc on a switch could you put it on a varable control? and then be able to slide those 10 KCs?
has anyone ever tried this mod before? and does it work?

thanks

Someone said to get the Larsen NMO27 coil & whip. I used one for a while. It's a pretty good antenna, but don't expect the kind of bandwidth you get out of other CB/10m antenna rigs. I used the 30MHz coil on mine and the extra long whip.

You should be able to pick one up from Tessco, Hutton or any of the big-name radio 'quipment suppliers. The local radio shop here carries the Larsen lineup too.

Indeed. And how *ANYONE* can consider a test that uses only
prepublished questions with their exact answers,studied at
will and completely possible to memorize unrelated word
associations to accomplish a passing score, as "of quality"
is beyond reason. It's just another Federal copout. Looks
good on paper if that's all you see.

4220. Bone Mic for CB

Newsgroup: rec.radio.cb
Date: 1999-12-31 00:00:00 UTC
From: emcm@city-net.com
Message-ID: <386f1c93.2023433@news.city-net.com>
Source record: 17669

Does anyone have any experiencine using one of the
mike-in-the-earphone units? They're available for cell phones and
Motorola Talkabout units for about $19.00.

I'm looking a adapting one of these for use with my CB. Considerations
are fidelity and noise/voice pickup. While my soft top Jeep isn't
tremendously noisy, it's noisier than a standard car. I'm concerned
that my voice may get lost in other vibrations.

Any opinions are appreciated.

Ed

Well, now I wonder - has the FCC considered the fact that there will be too few Extra class callsigns to go around?

I don't care what they say, I'm still taking the 13wpm next week and "they" can't stop me!

Why couldn't they do something really constructive, like move the 40M novice CW segment someplace where the broadcast stations aren't stacked end to end every night?

And Surprise! I am already on record as being able to buy
that, even though I believe that every ham radio operator
should take it upon himself to be able to use code.
But you saw what the FCC said--essentially that "Our
solution is the one that causes us least work and time to
administer". Clearly they're never going to change it, in
our lifetimes.

Way to go, Don. YOU will be one of the few *REAL HAMS* to
emerge from all this.

While you're at it, just go for the Extra, too, prior to
April 14. You can get the 20wpm code in a month if you use
the W1AW code practice sessions on the air- which I would
imagine they'll probably discontinue after April 15 since no
one will need to use them for upgrading anymore.
If you do, try copying the sessions where they start faster
code first, then slow down progressively. Just relax and
listen, copying whatever you can at the faster speeds, then
when the slower segments come along you find that you can do
better than you thought! Try this for a month and you'll
have it. Good luck.

>Everybody CW's in english?

The international language of Ham radio IS English, whether in code or not.
(not to say you won't hear other languages)

>Since when is no CW lowering standards.... .

The CW requirement still stands at 5 word per minute for HF use (below
30Mhz)... it is an international treaty requirement. The FCC will not do
away with CW unilaterally and it's future is unlikely to be discussed at the
next WARC council. The 5 wpm will give you General Class privileges (SSB)
on ALL of the Ham Bands. The change made, was to drop the 13 and 20 wpm
General and Extra CW requirements to 5 wpm.

>It is useless in 1999, period...

I don't agree it's useless...not in a HOBBY anyways... there's always a
place for tradition AND it IS the mode that most of the rarest DX uses.

>If you are afraid of too low of standards then why not require an
>electrical engineering degree

There was talk of toughening the written exams... FCC nixed that.

4231. 2510 molex connector diagram

You asked why if a 1000 pf capacitor works, then why wouldn't a 5000 pf be five times as good. The answer is that it might be 5 times as good. However, there is the issue of self resonance, which I already mentioned earlier.

The leads of the capacitor have some self inductance, and as I said, you want to keep the leads as short as possible. Even if they are short, they still have some inductance, and this inductance is in series with the capacitance and forms a series resonant circuit. For example, a 1000 pf capacitor with 1/4-in leads will have a self resonance of 35 MHz. A 10,000 pf capacitor with the same leads has a self resonance of 12 MHz. Get the picture? At some point you reach a diminishing return.

: i was just wondering what the group feels is the best method(s) to
: obtaining
: the best audio quality,now i dont mean loudness and echo...i mean
: downright
: quality audio...do you guys prefer modified radio's with stock mic?power
: mics?mic pre-amps??or what,what do you guys run,and what reports do you
: get?basically what im trying to say is,what do you feel is the most
: important
: approach to quality audio...whether it be am,ssb, or even fm?????

It depends on the radio. What you want is 100% modulation (or very slightly
more). That might entail modification to the radio or a different mike.

If you want more punch, then a speak processor helps.

I use a rig with the stock mike. It has a nice speak processor, and I
monitor the audio with a scope.

Yep. I always thought that the pre-published question pool was a
mistake. If a person was able to learn CW at 20 wpm and do a bit
of memorization, then they could have an Amateur Extra Class license.
The result - an Amateur who can send/receive code at a high speed,
but may know next to nothing about electronics.

That has now been simplified to only needing to learn 5 wpm Morse.
You can handle about that speed after simply memorizing the code.

I guess I will finally be getting my Extra Class license. The
11 wpm plateau where I have been stuck for several years will no
longer be a barrier.

I just wish they had the old style questions - where real electronic
knowledge was required.

Nope. Only on what the meter may read - or how the transmitter may load
into the coax. The length does not change the actual VSWR.

> the newcomer idiots running around on 2 meter repeaters playing "radio
> operator".

Sean, that is like comparing apples and oranges. You say you respect the "old schooler's" because they have been around for a while and have "tons of hands on experience."

Now, how can a "newcomer" meet those requirements? The fact that they are a "newcomer" obviously means they cannot have been around for a while, and therefore cannot have "tons of hands on experience?"

These "old schooler's" were once "newcomers" also. They matured to become the "old schooler's," just like the "newscomers" of today will eventually mature.

However, there is one major difference between the "newcomers" of today, and the once "newcomers" that matured to become the "old schooler's" of today. They did not face the intolerance within the ham radio community the "newcomers" of today face. In their time (as a "newcomer"), they were welcomed into the ham radio community.

In addition, times change, Sean. When it comes to new technology, the "old schooler's" are no more advanced then the "newcomers." For example, many of the "old schooler's" are having a difficult time adapting to the use of computers in the radio room, and are often turning to the younger "newcomers" for guidence. In the process, many of the "newcomers" are acquiring bits of knowledge from the "old schooler's" in exchange - knowledge that the "newcomers" of tomorrow will hopefully learn from the "newcomers" of today.

By the way, Sean, you talk about "newcomer idiots running around on 2 meter repeaters playing radio operator." What are you doing on CB that is any more advanced than what they are doing? Are you an "idiot" "running around playing radio operator?"

>While we are on the subject, if 1000pf does the trick then wouldn't
>5000pf be five times as good.....

Yes, and it will also be five times as good at removing the signal you want. Essentially one is constructing a "low pass filter". Everything below the "cutoff frequency" will be passed and everything above will be removed. (No, it's not quite so black and white -- "attenuated" would be a better description than "removed") The larger the capacitor, the lower the frequency. Eventually, as the capacitor becomes larger, the desired signal is also rolled off. Each circuit is different. While 1000pf will be huge in one context, it will be insignificant in another.

>What i'm getting at is this. When shunting RF sometimes using a 1000uF
>cap does not work as well as using a 1000pF. Why is this????

All capacitors are not equal. A a basic capacitor is two parallel metal plates separated by an insulator. If that insulator is air, a 1000uF capacitor would not fit comfortably on your desktop. Various tricks are used to pack more capacitance in small volumes. Rather than using two simple flat plates, manufacturers will use a laminated structure or roll two sheets of foil separated by an insulator. That 1000uf capacitor would probably be an "electrolytic". Electrolytic capacitors use rolled foil separated by a thin paper or plastic impregnated with a chemical. The result is a very high capacitance per unit volume. Unfortunately, this structure creates enough series inductance to effectively disconnect the capacitor at high frequencies. In some applications connecting the 1000pf in parallel with the 1000uf would be useful. The 1000uf electrolytic can store lots of energy in a small volume, while the 1000pf, using construction techniques that result in low series inductance, will act as a short circuit at high frequencies. The resulting composite capacitor can operate over a wider frequency range than either capacitor alone.

A bewildering range of capacitors have been developed to cover a wide range of applications. Some capacitors are so specialized they are considered to be military secrets. If one orders one of these, expect to see men in trench coats parked outside the door.

An "ideal capacitor" does not exist in the wild. A real capacitor can be modeled as an ideal capacitor in series with a resistor and an inductor. At high frequencies the inductor acts like an open circuit, effectively disconnecting the capacitor. In some applications, such as a photo

flash, the energy stored in the capacitor must be extracted very quickly. Low series resistance is important here. Applications such as electric motor running or starting, require the capacitor to carry relatively large currents. A 10uf capacitor used for motor starting will be much larger than a 10uf capacitor used in audio amplifiers.

You mean like the driving test, Dick? Every state publishes a simple
study guide for the license test, and the tests are even shorter than
the ham license test. Every answer on that test is in that short thirty
or forty page booklet. I don't hear your outrage over this. And I
don't see you handing in your driver's license to demand a new, tougher, test.

If the filter is designed to handle 200 watts, then it will work.

Whether the filter will help with telephones/radios/tv's depends on just
how the interference is getting into the appliance.

: now.

: True! FCC and ARRL should have dropped CODE *YEARS* ago.
: Keeping code is what KILLED ham radio.

Bah! Ham radio was never killed. There are still hundreds of
thousands of Hams in the US.

On the other hand, CB is a ghost of what it used to be (thank the
gods). When the last sunspot cycle died (and the "Convoy" wannabes"
got bored) - it got quiet. In my local city of 50,000+, there are
probably only about 30 CBers - there used to be over 1000.

A lot of this loss of growth/shrinkage is due to computers. Young
people just have other interests now.

That is the prettiest gift wrapped piece of BS that I have ever seen. First of sir I nor does any other CBer need your or any other egotistical kilosyco ham operator, invite to join the elite. First of all I am a ham operator and if I ever run out of toilet paper you guess what the first replacement part I look for. I have found the ham service to be plagued with far more problems than the CB band. Between the obnoxious contestors, the rude channel master with the clique in crowds, interference from broadcasters and generally rude behaviour you can have all of the HF amateurs that you want. Please I will not even begin to start on the above 30mHz asses, this post could go on forever. Their list includes the HF list plus two more pages.
Now at the same time I have little use for CBers also. That is to say that over modulated, roger beeping, more power, more power, more power fools. You know, my radio bleeds 60 channels in all directions, my neighbors tv looks more like a o-scope than a tv and I aIways can get another kw if they dare complain again.
We all know both types from both services.I do use my Ham license occasionally and I do go into the cb band also. but I have found the best group of operators to be found on the outbands of 11m. Above 40 some true ssb dxers with stations to rival the nicest 20m contestors. The below 1 group is a bit more am inclined and seem to be more into conversational radio with great groups that meet everyday, topics on the technical end and just some old fashion people talking. It is great.
I took all of this space to say if you are a cber thats great, if you are a ham operator great or just a plain old outbander great also. Why does it have to be he is right or I am right, this is better that that. Better to all, is you do your thing I will do mine. If I run into you doing yours as I do mine, lets shake hands and move on. To the people that want to look at the legalities of this and point a finger, please look at all the facets of your life and then we can talk. Even if we find the person that can live blameless, how blameless is a person who finds it necessary to point the finger, to him I give the finger.
one last thing to the one person that reads all of this bullshit, thanks and great radio to you.

As far as the 11m outbanders on 10m. That is by far the exception and I think you know this. I do not think that grouping all the outbanders with this one is as fair as grouping you with the fools that operate the exclusive net on7165 on Saturday evenings. After all if a outbander is a outbander that a ham is ham. I belong to both of these groups and refuse to grouped totally in either group, as I am sure you do.
as far as your cb equipment and ours. It does not really matter, you cant change it and in my opinion makes you look rude and somewhat obnoxious. By the way my Cb equipment is also my ham equipment, works great that way!

I think it's a good thing. My time is better spent on theory
than code anyway. After April 15th, I can upgrade to General
for "free", that is, because I got my Tech back in 1976 I took
the General theory and 5wpm already. BUT----

Not that the code is now "done" with me, I'll probably get
the study guides to do an upgrade to Extra. And I'll keep
my current callsign. As my company is doing some IC design
of 2.4 GHz radios on a chip, that theory could come in handy.
Code isn't useful at work anyway....

Do you mean a Saturn and a Saturn turbo?
The Saturn turbo puts out more wattage and it has nicer meters and knobs where the Saturn has toggle switched. Obviously the Saturn turbo has a bigger power supply. In my opinion it is a much better radio.

I never classified Ham radio operators as 'elite' ...you did that.
Also many CBr's -would- like to join the Amateur ranks and they are even
more welcome now to do so thanks to the relaxation of the CW requirements.
I think you got up on the wrong side of the bed today Jeff. Frankly I
must say your view of the Ham Radio bands is a narrow one which while
specifying some problems any radio service may have certainly does not give
an accurate picture of life on the Ham bands. As I already stated I was
once a CB'r myself and respect those that are lawfully enjoying 11M. I
think you just have a chip on your shoulder for some reason.

By the way just had a nice chat with JA1LZR (Joe in Japan) on 17 M. No
Y2K trouble to report from Japan where it is already Jan 1,2000 73 / DX

I have always understood it to be an inverse relationship;

The higher the WPM , the lower IQ .

If society ever required me to live a binary (ie dit / dah) guided life,
then I may have a need to be a CW kind of in-DUH-vidual...

It's too late now, of course, but I wish that the FCC had two-tracked it. They could have had code and no-code (or 5wpm) tracks. Leave the CW portion of the Extra band for folks who can pass a 20wpm test. Leave the phone portions for folks who don't care about CW. The good news is, people who don't want to learn the code are still going to stay out of the code sub-bands.

I don't think it will affect me... I will keep on repairing the gear of the
coded
ticket holders who can pound cw, but aren't as successful with sand.

Oh, and I will do that with the extra burden of being a no-code tech,
overcoming social adversity to prove I am smart enough to pound sand.

Perhaps NOW the only thing to discourage new hams is this type of
"better-than-thou" ham snobbery.
I use my legal CB radio regularly to help truck drivers with directions
and just for general chit chat. I have even made a few friends with it. I
have never dead keyed, intentionally talk over anyone. Never caused
interference with the neighbors electronics. Never cursed or put down anyone
with my CB. But there are many hams like Dave that regularly knock me (I
realize not personally) because I am a CBer.
But I guess, what good is a club if you let everyone in, right? Keep
some that want in out, then we superior!

Dick ,your answer was not germaine to the question.!
Has logic failed you for you to respond in such a nonsensical way?
Code users will still be able to practice any where
and on all bands so what is the problem? Those who feel that
code is the essence of being a' real ham' can still continue to
flourish if the newcomers hold to the same ideals as those
soon to become silent keys..
As for being a "real ham"
would you suggest that any engineer must work on an
assembly line until the task at hand can be done
without thought, automatic, before he be allowed to
have a P.E.licence i.e. to make him a 'real" engineer?
Instead of being just a gas bag hooting in the forest
try applying a modicom of civility and logic in your
communications with the newsgroup or groups that
you appeared to have stumbled into.

4290. Battery Question

Newsgroup: rec.radio.cb
Date: 1999-12-31 00:00:00 UTC
From: Frizz <senorpurpl@hotmail.net>
Message-ID: <84jsio$q47$1@bob.news.rcn.net>
Source record: 17739

OK,
I have a little Yuasa security system battery that puts out about 4.5mAH or so at 12 volts. Now, if I hook this in series with my power supply (PS=Battery=Radio) it takes the noise out of the power supply since it is a switching supply. Is this safe to do and what is the amperage of the total 'system' I have created here? I have also tried hooking up my Pal 225 in this same fashion, and other than the small wires that I was using that can't handle the amperage, it worked fine with no noise as well.

Also, if I where to get about 5 of these batteries and hook them up in series again with a small power supply pushing them to keep them up in power (sort of a trickle charger) (PS=Batt=Batt=Batt=Batt=Batt=Device) could I use this too? This would be a base application and I am sort of new to the world of powering station equipment with batteries.

Ok, thats it, THANKS FOR YOUR HELP AND HAVE A HAPPY NEW YEAR!!!

I guess since we are kinda on the topic of clean signals, what are some older tube amps that are fairly clean? I know that Varmints are pretty dirty but how about the Palomars and others? Or what about the newer transistor amps? Which are cleaner and which aint so clean? Thanks!

John wrote in message <386CD779.8ADCA1C7@netscape.net>...

The only problem with out banders on 10 meters that I've heard on the DX is a couple truckers that use a a couple different freq.. I think the most annoying thing on 10 meters is the contesters ,it used to be that there were a few more rag chewers on the band , I really feel that the best dxing and operators are in the freeband , and as Americans that we should find a way to protect it , just as we keep struggling to do with protecting our right to bear arms!!!!!! Like get it in your heads no one is better than each other , we all posses different values and ideals , thats what makes us all unique,and also what makes America what it is !!!

DO NOT remove the audio limiter in this radio. It ruins the ssb performance.....If anything put a power mic on it and it should be plenty loud enough. I talk with the locals every night on mine, and by locals I mean near 80 miles away here in the mountains of northern Idaho.....with legal power .....It's the antenna that makes the difference....I run a starduster for an omni, and a Moonraker IV....Tom

Iv'e heard that argument for many years. The codeless tech license has
been
with us since 1991. There must have been a flood of all the EE's, and
other brainiacs
into our wonderful hobby. With all of this cranial enhancement, I have
to ask why not
one of these codeless techs have not brought-forth a significant
technical or design
to advance amatuer radio's state of the art.

Have a happy......
N8TB Tim

I know such guys, too. And their main reason not to bothr about an amateur radio ticket is that they prefer to talk to sensible guys. And somehow, the above quote proves their point.

To hold CW responsible for the presence of alternatives for long distance communication, and thus of the presence of choice, and thus of a significant number of people opting for internet instead of amateur radio, is simply absurde.

>
> Dwight Stewart

Thats right Dwight ,I always heard how hard it was to become an extra
and had a lot of respect for the "radio Gods",then with no radio or CW
knowledge I started studying and had my extra 7 months later.I still
didn't really know anything about radio,just the code.I no longer
respect extras just because they are extras,and now even a poodle can do
it.They should have made the requirements harder,not dumbed it down.

The problem is that exams always trail the state of the art. The old commercial 'phone tickets were courses in radio-archeology. Then there is the matter of the licensee getting older. Some things don't change (antennas for example) but knowing that a quarter-mil of grid current is all one should draw on a 6146 won't do a whole lot for him or the hobby today.

Ultimately, one arrives at the conclusion that amateur licensing is a lot like driver licensing: be sure he knows the rules and posesses enough physical skill and ability so as not to be a direct party to an untimely death - then let him go.

In a hobby as multi-faceted as AR, much more than that is more harm than good. We will survive or we won't but licensing won't be a factor in much more than the speed at which it happens.

This is a worldwide one set into motion on the CBradio@egroups.com mailing list. It is a big one with help from alot of REACT groups. It was advertised by Florida REACT and was sent to the National REACT. Along with the radio contact going on everyone is encouraged to report via mailing list as well. There have been frequent updates as to how things are progressing. Stop by join in, and see the world's technology collapse. Er....well um maybe not.

4324. CB vs. Amatuer

Newsgroup: rec.radio.cb
Date: 1999-12-31 00:00:00 UTC
From: station53@webtv.net
Message-ID: <4916-386D13C8-24@storefull-283.iap.bryant.webtv.net>
Source record: 17773

People in my area feel less restricted by the protocols of amatuer. Amatuer has dwindled in my area mainly because a lot of hams feel more "liberated" on CB sideband. Unlike CB, hams in my area seem to hold to their own certain agenda and tend to make people feel like outsiders when they don't play along. Older amatuers do nothing to attract the younger generation, and that is why VHF and UHF are so "ghostly" in my area. And now that there has rumor of the FCC wanting to sell off amatuer bands, all of a sudden these hams want to preach "inclusion" in order to get the numbers up.
I love CB radio and Amatuer radio, but I am also a realist. Show CBers who aren't
amatuers already that there is a legitimate place for them, and they will come. Happy end of the millennium to all. KC5GGN

Oh, yeah. And the pinko commie ARRL caused Sputnick to screw up the
weather. I also heard they had something to do with the Kennedy assination
and the 1918 influenza outbreak.

Good grief, if some people only knew how goofey they sounded. And to think
they give them HAM radio licenses. There ought to be a test.

That's a lie, Dick, and you know it. I passed the 13wpm Morse code and flunked the written exam first try. Second try, the ham didn't have any way to send Morse code to me. He called the first ham and asked him if I could do 13wpm. The first ham verified that I had done five minutes of solid copy at 13wpm six weeks before. My code test and written test were given by different hams. The same thing is possible today.

> proficiency test..
>
> don
>
1) Who said "broadcasts" of the type W1AW is doing are not legal? Not the FCC regs.

2) Just because someone is opposed to a 20wpm code test to get a ham license does *not* mean that they're against CW or opposed to helping someone who wants to learn code at 20wpm or higher accomplish that.

Many are getting too carried away with this thing. If you love CW you should be doing back-flips because we didn't loose any bandwidth in the process.

>Bob

In all honesty, the ARRL was caught off-guard by the FCC proposal to restructure and was at first unprepared to respond. What the FCC finally came out with cannot be laid at the ARRL's doorstep... the ARRL's response and proposal came several weeks after the initial ARRL proposal. MANY, MANY, other groups and individuals were pushing for dropping the code altogether (not unilaterally feasible with international treaty) and many were pushing for Automatic upgrades of existing Tech and advanced licenses. Looking over the ARRL's proposal to the FCC and the FCC's final document, I'd say the FCC pretty much brushed aside most of the ARRL's proposals (tougher written exams, no multiple-guess CW exams, 4 license classes, and 5 & 12 wpm CW requirements)

The FCC final decision was their own, NOT the ARRL's and bears little resemblance to the ARRL's counterproposal.

What's needed now from US Amateurs is not condemnation... The FCC won't change it's mind just because a bunch of us are pissed off! Rather, work with the new licensees, and encourage them to explore the many facets of Amateur Radio.... I watched many a VE quit after the introduction of No-Code licenses...they changed NOTHING!!! (..many dropped out of the ARRL after no-code licensing, even though the League was the LAST organization to get on the bandwagon.. they were afraid of being left behind) What they did was give up one of the best chances they could have ever hoped for of aquainting new hams with appropriate on-air behavior, with the pleasure of code and Ham traditions and lore. By turning their back on no-coders last time around many more experienced hams fostered the very operating practices they were so worried about by not being there as elmers! Get involved with your beloved hobby of ham radio with OTHERS... it's not something to be worshipped in a corner of your basement shack!

A last thought.... the bureaucrats and businesses who'd like to auction off or buy our spectrum must dance with absolute glee each time we rip ourselves apart over the "details"... One of these days in the middle of one of our

infights over the "small stuff" we're gonna' turn around and find that our bands have been auctioned off while we were preoccupied with each other!

My first though too - but, he qualified it "with a minimum of
equipment". With that as a requirement it's pretty hard to beat CW.

Please, don't be so condescending and presumptuous. You seem to think that "CB'ers" are not already licensed as amateurs operators, and you also seem to think that "CB'ers" are doing something illegal, as evidenced by your last quip "join us ..... see you on the bands! (legally)". Perhaps people like yourself make CB more attractive.

I am an amatuer operator myself, but I can't figure out why some other hams felt the need to clutter this "CB" newsgroup with information on amatuer radio. Certainly there is an amatuer NG for this information to be posted into for all who wish to see. Why try and take over everything? We've got all these amatuer bands to operate on, and yet we still want to try and regulate what 11 meter operators do. When I look in this NG, I expect to see info on Citizens Band, not the Ham bands. Don't be a control freak; get a life.

What they should do is create two classes of license. Both classes
have the same privledges. One requires code and one doesn't. Then,
the hams with the code license can start huge arguments with the hams
with the no-code license, even though their both allowed to talk on
the same frequencies.

The reason for the Ham posts in the CB ng is because Ham radio (starting April 15,2000) is now more accessible then ever . It is a simple extension of basic logic that some CBr's who are already radio operators anyway might like to know of this recent Amateur rules change.

> but may know next to nothing about electronics.

It is a fact and there are numerous examples. No ham radio
test ever was that difficult, in terms of comparing it with
engineering, but the question pool scheme has been too far
out of range.

> That has now been simplified to only needing to learn 5 wpm Morse.
> You can handle about that speed after simply memorizing the code.

I doubt that very many hams will pursue it further now that
it won't be required.

> I guess I will finally be getting my Extra Class

I sure would. in your circumstances. I'd imagine a couple
hundred thousand others will, too since most won't be
required to much of anything else. How do you sort them
today? You don't.

The
> 11 wpm plateau where I have been stuck for several years will no
> longer be a barrier.

Mostly those barriers are caused by a couple of things.
One, learning the code character formations at too slow a
speed and never finding a way to re-learn them at speeds
higher than the "plateau". When one learns with Farnsworth
speed character formation speeds, where the code is formed
at ~15 to 18 wpm. but sent at slow-spaced, slow word speeds
it helps eliminate that difficult "hump" transition. Most
people who stay stuck at a "plateau" fail to learn that.

The other factor is that one will never learn code at
higher speeds unless he "pushes" himself to try to copy
considerably faster than he is able to copy. When you listen
to faster code, copying first the simple short words that
you can pick out, you find with a little time that you're
copying more and more of it as practice goes on, and you

start to hear words instead of just characters. Then when
you listen to the slower speed practice, it seems astounding
how slow "ordinary" speeds are, and how much of it you copy.

So you have to really make yourself work to practice beyond
your capacity, and you find that your capacity moves on up
to levels you never expected.

> I just wish they had the old style questions - where real electronic
> knowledge was required.

Ain't gonna happen anytime soon, I'm afraid. FCC just
dumped the whole testing scheme on to the VEC system, and
W5YI is on record as intending to eliminate theory from
written tests. Since he has installed himself in the
3-member Question Pool committee which decides exactly what
will constitute *all* the tests, it seems like done deal.

My time as a VE ended permanently yesterday, unless
something pretty drastic changes that I can't forsee at this
time.

Sure it is, as INFORMATION PRESENTED, not the exact
questions and answers.
Nice try at distortion, but it didn't work. There's NO
correlation whatever. You have to read and understand the
material to come up with the answers.

I have a peaked out Galaxy 959 radio in my car that when I key up the lights on it dim. I think that since now it has been peaked out, it is trying to draw more current than the stock power leads can produce. To remedy this, I am thinking of replacing the power leads with heavier gauge wire. Does this sound like the answer to the problem?
Thanks!

So being that i now hold tech+ license all i will have to do is pass a written test & i get my general? Wow thats cool cuz i got my tech when i was 12 & a year later learned the code for just long enuf to pass the 5 wpm test. now i'm 20 & have totally forgotten the code. so to get my general all i gotta do is study & take the exam, am i right? ant to those who think the question pools are a bad idea, i can still answer most of the questions in my technician study book after 8 years. I didn't memorize it, i learned it. and i assume that's what's inevitable when studying for the exam if you have an interest in radio (if not, then why do you want a license?) allright.... 73

Wire the radio directly to the battery and possibly get a new battery
with more amps.

The radio is being "current limited". You need to make sure that the factory power cord is kept as short as possible. If you need a long run, cut the factory supplied cord a few inches past the fuseholder and connect heavier wire to it. Depending on how long the run is will depend on how heavy of a wire you should run. In most cases, a 12 - 14 gauge wire is plenty.

Make sure that all connections are solid and well insulated. If going to the battery, make sure that the line is fused right at the battery. This protects the electrical system should a short develop due to rubbing through the insulation. A 10 amp fuse for the radio alone would assure that it would not blow unless a short did occur.

You may also want to verify that you have the proper fuse in the fuseholder. It should be appr. 4 amps and no higher than 5 at the max. I have seen situations that the fuse was actually current limiting, but would not blow. Kind of weird, but it happens. Sean

Oh, that's the plan, but time to practice is the problem. People have asked me if my hearing is bad because I go around with an MFJ tutor in my shirt pocket and earphone in my ear.

I wonder if the ARRL bulletins will drop down to 5wpm, too or just go away. I find it strangely schizoid that ARRL "broadcasts" (hey, that's not legal anyway!) code practice 3 times a day and is against a 20wpm proficiency test..

>Bill Nelson wrote:

>> I just wish they had the old style questions - where real electronic
>> knowledge was required.

>Amen to that!

Old style questions? Let's see what the 1912 written test consisted
of:

"The written examination consists of seven questions and to answer
these you should know:
1. How to make a diagram of the transmitting and receiving apparatus.
2. How the transmitting apparatus is made and how it works.
3. How the receiving apparatus is made and how it works.
4. The International regulations for wireless communications and
the U.S. wireless laws and regulations."

Taken from _The_Book_Of_Wireless_, Collins, 1915.

These were essay-type questions, and as the government examiners
were fond of saying, "What you fail to say, you don't know."

Well, I have to put my $.02 in... I am a ham, Tech No Code and I've gotta say I've very happy with the new restructuring. It will be much easier to get 5 WPM down. Previously it wasn't worth my effort because I wouldn't gain a whole lot from 5 wpm, because to upgrade further, I'd have to get faster and faster. Now I can upgrade with 5 wpm, get on the bands I've wanted to get on, and I'll be able to work on my code speed through practical application. I see myself moving through the classes quicker now.

Thanks FCC! :)

Dwight, i'm sorry if i offended you personally. It was meant as a generalization and did not target anyone in specific. As to your comments about me "playing radio operator", i would beg to differ. Unfortunately, I rarely have time to make use of my radio system like i want to.

As it is, the difference between myself and the majority of "elite" 2 meter users is that i have the knowledge and skills to work on, repair, design, assemble, install and tune my whole system from top to bottom. I can do all of this even if i don't have an FCC assigned call sign.

Being able to do basic maintenance and diagnostics on one's system is what separates a "radio operator" from a "radio user". A radio operator knows how to get the best performance out of their installation. A radio operator knows how to keep it working. A radio operator takes the time to do things right. A radio operator has great pride in their "shack" or "mobile", because it reflects the effort that they have put forth in doing neatly. Radio operators are the ones that lend a helping hand and offer guidance to those that are less knowledgeable, yet want to learn to do things the right way.

A radio user is one that turns on the switch and talks. I don't have to have someone else show me how to do the above things, unlike the mass majority of cb'ers and licensed 10 / 6 / 2 meter users.

This is not to say that i look down upon users of these bands. On the contrary, i share the love of the hobby just like they do and wish them the best. Some of them are truly "radio nut's" and are trying to advance their hobby and operating skills. How could i look down upon anyone trying to increase their knowledge and better themselves ?

It's too bad that many of these same folks, even though they may still use CB periodically, now feel the need to try and belittle "the unlicensed". They flaunt their piece of paper and call sign at every opportunity, trying to show how much better they are than the "lowly commoner's". Yet they come crawling back to some of the more knowledgeable "unclean" when they need help.

It is this type of hypocrite that leaves such a bad taste in our mouths and it is all too common. I deal with this type of "ham" all the time. I get to listen to them badmouth the "11 meter idiots" when they talk 2 meter with their "elitist clan". I get to see these same brain surgeons when they need their mobile antenna tuned or have simple problems that they should have been able to diagnose / take care of themselves. That is, IF they were radio OPERATORS and not merely radio USERS.

If the ham radio community actually still had and encouraged "Elmer's", more CB'ers would become hams. They would also have people setting examples of proper radio etiquette. I applaud the few hams that have stuck through things here and offer words of wisdom and share their knowledge. If the ham radio community had a few more Bill's and James's around (just to name a few), there would be a lot more cber's being converted. Unfortunately, they are the rarity and not the norm.

Don't forget your roots. You had to start somewhere too. Help people along the way. Set the example and have patience. If you want things to change, you have to work for it and it takes time. Don't become one of those that actually repel those from the hobby you love and would like to share. Nobody likes a fountain of negativity, especially when they are preaching down to the masses. Sean
>

Dwight Stewart wrote in message <386C6FA8.D3FCB330@amouse.net>...

By the way, Sean, you talk about "newcomer idiots running around on 2 meter repeaters playing radio operator." What are you doing on CB that is any more advanced than what they are doing? Are you an "idiot" "running around playing radio operator?"

Well, I have to put my $.02 in... I am a ham, Tech No Code and I've gotta
say
I've very happy with the new restructuring. It will be much easier to get 5
WPM
down. Previously it wasn't worth my effort because I wouldn't gain a whole
lot
from 5 wpm, because to upgrade further, I'd have to get faster and faster.
Now
I can upgrade with 5 wpm, get on the bands I've wanted to get on, and I'll
be
able to work on my code speed through practical application. I see myself
moving through the classes quicker now.

Thanks FCC! :)

4387. Re: Question about TVI filters

Newsgroup: rec.radio.cb
Date: 1999-12-31 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <lN7b4.8732$M56.274413@news.corecomm.net>
Source record: 17836

Good point Bill and thanks for pointing that out.

Adding a power line filter in the form of a "RFI / EMI" type power line
strip may do wonders in your situation. Try it on your radio gear. If that
doesn't work, try checking with the neighbor as to where the interference is
coming in.

I had one installation that the radio user was clobbering the neighbors TV
and Stereo. Turns out that they were both plugged into the same outlet.
Putting a $10 power line filter there completely got rid of the problem.
Too bad there not all that easy. Sean
>

Bill Nelson wrote in message <84hptv$341$21@bashir.peak.org>...
Charles Golden <cgo2541273@aol.com5200> wrote:
: Will a TVI filter do any good with a 200 watt linear? Also Do they also
help

the
: best place to get it? Thanks for any help.

If the filter is designed to handle 200 watts, then it will work.

Whether the filter will help with telephones/radios/tv's depends on just
how the interference is getting into the appliance.

4388. Re: Radio problemin Dodge truck??

Newsgroup: rec.radio.cb
Date: 1999-12-31 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <2Q7b4.8733$M56.274625@news.corecomm.net>
Source record: 17837

What is the swr like ? I have seen installations that were "grounded" yet
they really weren't.

Lack of ground increases feed line radiation. This produces stray voltage
getting into the trucks wiring, which is acting like a long wire antenna.
Make sure that everything is properly tuned, clean grounds and try
relocating the coax cable to another area of the vehicle. Sean

Interesting analysis. And in the early days of amateur exams (pre-1930), what was the Morse proficiency requirement?

Since we have such a fixation on the way things used to be, I would argue that before incentive licensing, the pre-1950s amateur exam resembled more closely the new licensing structure that will take effect next year. What was the Morse requirement on the Class A and Class B amateur exams?

If the battery has enough power to consistently crank the vehicle over, i think it could run the radio properly. It's just a matter of getting the power from the alternator / battery to the radio in an efficient manner. Too much loss in the scrawny wiring, that's all.

Keep in mind that a small amount of dimming is normal, even with heavy wiring. Sean

FAQ for SSB_RAGCHEWERS

This is the FAQ for SSB_RAGCHEWERS and, it has been produced to help new/existing subscribers to the list find their way around..
This is not the full 'Mission Statement' for this list. That is available elsewhere and this is intended as a general guide only.

Suggestions for modifications/extras are welcome.

WHO IS THE LIST MODERATOR

You are!!
The official moderator is 56-WA-444, Julian (julianw@saunalahti.fi) with assistance from 108-AT-020, Colin (colin.020@telinco.co.uk) but, this list will work in keeping with your input.. Remember, EVERYONE'S opinion matters..

WHAT IS THE PURPOSE OF THE LIST

The purpose of the list is to enable like minded individuals to share information/experiences/resources in the pursuit of their hobby.

HOW DO I SUBSCRIBE/UN-SUBSCRIBE

If you are reading this then, you are already subscribed but, in case you wish to pass this information to a friend or, if you wish to unsubscribe use the following link;
http://www.onelist.com/subscribe/ssb_ragchewers
If you have a website, we would appreciate this link being added to it...
.
HOW DO I POST MESSAGES

Messages should be posted to ssb_ragchewers@onelist.com and should be in English. It is appreciated that English may not be your 'first' language but, go for it and, we'll try to understand..

WHAT IS 'ON TOPIC' FOR THIS LIST

Anything radio related is considered 'on topic' and, within the bounds of gentlemanly behaviour(?), should be of interest to other list members..
Please Note;
This is an 'open' list where everyone's opinion matters. If you make a statement that others disagree with or, if you disagree with someone else's opinion, try to remember that a reasoned argument is better for everyone than a 'flame war' or 'p*ss*ng contest'..
You will also be expected to 'kiss and make up' at the end of it.. After all, we share a common interest and co-operation is the only way to go..
You should also keep in mind that the 'official' moderators verdict on any disagreement is final unless, of course, you want to argue about it.. Hi..

WHAT IS OFF TOPIC FOR THIS LIST

You shouldn't really need to ask but, in general, the usual stuff.. Common sense would suggest that you do not make any attacks based on religion/race/nationality etc.. This is intended to be a 'friendly' list .. Try to keep it that way..

CAN I POST ATTACHMENTS OR HTML

No, attachments and HTML are removed from all mails by Onelists servers.. If you have a file of interest to other subscribers, Onelist provide 5Mb of storage for just this purpose..
PLEASE NOTE..
Contact the list moderator before uploading any files.. 5Mb is not a 'massive' amount of disk space and some/most of it may already be taken.. If you have any files that you want to make available, best is to place them on your own website and, let us know..
The list 'Files' area is at
http://www.onelist.com/files/ssb_ragchewers

WHO IS ON THIS LIST.

You can see the list members at
http://www.onelist.com/members/ssb_ragchewers

If we are trying to appeal to kids nothing we can do will help,for the
most part it is an adults hobby,nothing wrong with that.
The ARRL has always been against any code requirement regardless of
what they say.

It's not knowing the code,it's being willing to make a small
investment in the way of a little effort to get something worth
having,and if the crybabies didn't think it was worth having they
wouldn't be crying.
Having a few simple hoops to jump through helps keep out the moderatly
interested that wonder from hobby to hobby,job to job,wife to wife,and
take what they can get but never give because they were really never
that interested.

Okay, I got channel 39 LSB up but I thought the Y2K net was supposed
to be on channel 36 LSB?
